The leading divisions of the *Endoplastica*, as named by Huxley, are the *Amœboidea* (here called *Protoplasta*), *Gregarinida*, *Infusoria*, *Radiolaria*, and probably the *Cataliaca*.

The *Protozoa* are divisible into a lower and a higher group. . . . In the latter—the *Endoplastica*—a certain portion of this substance [protoplasm] (the so-called nucleus) is distinguishable from the rest. [Note] I adopt this distinction as a matter of temporary convenience, although I entertain great doubt whether it will stand the test of further investigation. Huxley, *Anat. Invert.*, p. 73.

The floor of the thoracic cavity [of the crawfish] is seen to be divided into a number of incomplete cells, or chambers, by . . . apodemal partitions, which . . . arise partly from the intersternal, partly from the interepimeral mem-

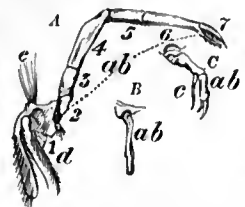

brane connecting every pair of somites. The former portion of each apodeme is the endosternite, the latter the endopleurite. . . . The endopleurite . . . divides into three apophyses, one descending or arthrodial, and two which pass nearly horizontally inward.

Both endopodite and exopodite are parts borne upon that part which is called the *protopodite*, and both are variously modified in different parts of the body of the same animal. The epipodite may become a gill, etc. The endopodite becomes in the thoracic region an ambulatory limb, and is then the ordinary "leg" or "claw" of a crab or lobster. When thus fully developed, it consists of 7 joints. These are the coxopodite, basipodite, ischiopodite, meropodite, carpopodite, propodite, and dactylopodite, named from base to tip of the leg, in Milne-Edwards's and Huxley's nomenclature. The nippers or chela at the end of such a developed endopodite are the sixth and seventh of its joints, namely, the propodite and its movably apposable dactylopodite.

a, Developed Endopodite, or ordinary ambulatory leg of the crustacean; *ab*, the whole extent of the endopodite with seven joints; *c*, coxopodite; *d*, basipodite; *e*, ischiopodite; *f*, meropodite; *g*, carpopodite; *h*, propodite; *i*, dactylopodite; *j*, filaments borne on coxopodite; *k*, an epipodite. *B* and *C*, appendages respectively of first and second abdominal somite of the male; *ab*, endopodite; *c*, exopodite.

which lies within the integument, and is covered by flesh and skin, as distinguished from the *exoskeleton*. In man and nearly all other mammals it constitutes the whole skeleton. In invertebrates the term covers any hard interior framework supporting soft parts, as the apodermal system of arthropods, the cuticle of a squid, etc. The endoskeleton of vertebrates is divisible into two independent portions: the *axial endoskeleton*, belonging to the head and trunk, and the *appendicular endoskeleton*, to the limbs. endosmosis (en-dō-smō'sis), *n.* [NL., *< Gr. ἐνδον, within, + ὥμος, impulsion, < ὠθεῖν, push, thrust, impel.*] The transmission of a fluid inward through a porous septum or partition which separates it from another fluid of different density: opposed to *exosmosis*: see *osmosis*. The general phenomenon of the interdiffusion of fluids through septa, including both endosmosis and exosmosis, is termed *diösmosis* or *osmosis*, but *endosmosis* is also used in this sense. The phenomena differ from diffusion proper in being affected by the nature of the septum.—**Electrical endosmosis**, the cataphoric action of the electric current; the passage of an electrolyzed liquid through a diaphragm from the anode to the cathode. Some of the laws of the phenomenon have been made out, although it is not fully understood. The amount which passes is proportional to the intensity of the current and to the specific resistance of the liquid, and is independent of the area and thickness of the diaphragm. The hydrostatic pressure required to prevent the phenomenon is proportional to the thickness and inversely as the area of the diaphragm.

endosmotic (en-dō-smō'tik), *a.* An incorrect form for *endosmotic* or *endosmic*.

endosmotic (en-dō-smō'tik), *a.* [*< endosmosis (-osmot-) + -ic.*] Of or pertaining to endosmosis; of the nature of endosmosis. Also *endosmic*.

Root-pressure is probably a purely physical phenomenon, due to a kind of *endosmotic* action taking place in the root-cells. *Bessey*, Botany, p. 174.

Endosmose is independent of any interchange, since it results entirely from the attraction of the dissolving substance for the solvent; and this attraction is invariable at the same temperature, and may be termed *endosmotic* force. *Sachs*, Botany (trans.), p. 597.

Endosmotic equivalent, the number expressing the ratio of the amount by weight of water which passes through a porous membrane into a saline solution to that of the amount of salt passing in the opposite direction.

In some sponges a part of the endoderm and associated mesoderm may likewise develop independently of the rest of the sponge, as in the *Hexactinellida*, where the choanosome forms a middle layer between a reticulation of ectosome on the one side and of endoderm and mesoderm, i. e., *endosome*, on the other. *Encyc. Brit.*, XXII, 415.

7. In *physics*: (a) Half the sum of the masses of the particles of a system each multiplied by the square of its velocity; half the *vis viva*. See *vis viva*. This sense, introduced by Dr. Thomas Young, is now obsolete. It gave rise to the following, which was introduced about 1850 by Sir William Thomson, and is now widely current. (b) Half the greatest value to which the sum of the masses of all the particles of a given system each multiplied by the square of its velocity, could attain except for friction, viscosity, and other forces dependent on the velocities of the particles; otherwise, the amount of work (see *work*) which a given system could perform were it not for resistance dependent on the velocities. The law of *energy* is precisely the principle that these two definitions are equivalent. This law applies solely to forces dependent alone on the relative positions of particles—that is, to attractions, repulsions, and their resultants. It is shown mathematically that, taking any two level or equipotential surfaces (see *equipotential*) which a particle might traverse in its motion, the difference of the squares of its velocities as it passed through them would be the same no matter from what point of space it started, nor what might be the direction and velocity of its initial motion. Thus, the square of the velocity at any instant could be deduced from that at any other by simply adding or subtracting a quantity dependent merely on the positions at these instants. In like manner, if a number of particles were moving about, subject to mutual attractions and repulsions, it is shown in dynamics that if to the sum of the masses, each multiplied by the square of its velocity, be added a certain quantity dependent only on the positions of the particles at that instant, this last sum would remain constant throughout the motion. Of these quantities, half the mass of a particle into the square of its velocity is termed its *actual energy*, or *energy of motion*—that is, its *kinetic activity*; while the quantity to be added to the sum of the actual energy in order to obtain a constant sum is termed the *potential energy*—that is, the latent or slumbering activity, or *energy of position*; the constant sum being termed the *total energy*. The corresponding general principle of physics is that the total energy of the physical universe is constant; this is the principle of the *persistence or conservation of energy*. (See below.) Examples of actual energy are the energy of sensible motion as in a moving cannon-ball, of sound-waves, of heat; of potential energy, the energy of position of a weight raised above the earth, of elasticity as in a bent bow, of electricity, chemical combination, etc. Potential or positional energy and actual or kinetic energy are in incessant interconversion; for positional energy implies force, or a tendency to motion, as much as kinetic energy implies motion or change of position. Thus, in the case of a swinging pendulum, the actual energy is null at the turning-points at the extremities of the swing, while the potential energy is at its minimum when the center of gravity is lowest; and the oscillation, but for resistances (as friction), would continue forever. Another equivalent version of the law of energy is as follows: Suppose a system of bodies were moving under the influence of those positional forces to which the law exclusively applies, and suppose that at any one instant all the particles were to strike squarely against elastic surfaces so as to have the directions of their motions reversed, but their velocities otherwise unaltered; then the whole series of motions would be performed backward, so that the particles would again pass through the same positions they had already passed through, and in the same intervals of time, but in the reverse order. Thus, a squarely rebounding cannon-ball in *vacuo* would move backward over the same trajectory, and with the same velocities, as in its forward motion, plunging into the mouth of the cannon again with exactly the velocity with which it had issued.

The heat which any ray, luminous or nonluminous, is competent to generate is the true measure of the *energy* of the ray.

Tyndall, Radiation, § 9.

The quantity of *energy* can always be expressed as that of a body of a definite mass moving with a definite velocity.

Clerk Maxwell, Matter and Motion, art. xcvi.

If we multiply half the momentum of every particle of a body by its velocity, and add all the results together, we shall get what is called the kinetic *energy* of the body.

W. K. Clifford, Lectures, II. 29.

Correlation of energies or of forces, the transformability of one form of energy into another. Thus, for example, when mechanical energy disappears, as in friction when a railroad-train is stopped at a station, or in percussion

when a cannon-ball is arrested by a target, some other form of energy, chiefly heat, is produced in its place; moreover, there is a definite numerical relation existing between the energy expended and the heat which is produced as its equivalent. (See *equivalent*.) A water-wheel is an arrangement for transforming the energy of water into some other form of mechanical energy, as for sawing wood or grinding corn; a steam-engine is used to transform the potential chemical energy of coal or wood and oxygen of the air into mechanical energy, as in a mill; and in a voltaic battery the potential energy of the zinc and acid is transformed into the energy of an electric current, and this in turn may be transformed into light and heat, or mechanical motion, or chemical separation (as in electroplating). It is found, however, that in every transformation, while no energy is absolutely lost, a considerable portion is lost as useful or available energy, being transformed into useless heat; further, it can be shown that the process which is continually going on is a change from a higher type of energy to a lower, as from heat at a high temperature to heat at a lower—that is, a *degradation or dissipation of energy*. If the change were to go on until all bodies were at the same temperature, then no work of any kind would be possible. The principal stores of *energy* on the earth, available for the purposes necessary to human life and comfort, are: (a) the energy of coal, wood, oil, and other combustibles; (b) of water in motion, or in an elevated position; (c) of air in motion, as the wind; (d) the muscular energy of animals. To these might be added the energy of direct solar radiation, the energy of the tides, and some others of less importance. The source of all these forms of energy, except that of the tides, is to be found in the radiant energy of the sun.—**Energy of recoil**, the capacity for work which a body has upon a recoil, as a gun when fired.—**Energy of rotation or translation**, the capacity of a body for doing work in virtue of its motion of rotation or translation. See *motion*.—**Extensive energy**, the number of different cooperating powers which enter into a mental state. The phrase is also applied to a kind of elasticity.—**Radiant energy**, that form of energy which is emitted by a hot body and which is propagated by undulations in the luminiferous ether at a rate of about 186,000 miles per second, as the energy sent out by a stove, by the electric arc-light, or by the sun. Every body sends out radiant energy, whatever its temperature, but as its temperature rises the amount increases, and to the sum of rays before emitted are added others of shorter and shorter wave-length. When the temperature of a solid body is raised to about 600° C. it begins to be luminous—that is, to radiate rays of red light—and as it grows hotter it emits rays corresponding to the successive colors of the spectrum. At 1500° C. it becomes white-hot—that is, radiates all the rays of the spectrum. That portion of radiant energy which is incapable of affecting the eye is generally spoken of as *radiant heat*, in distinction from *radiant light*. See *heat, light, spectrum*.—**The law of the conservation of energy**, or **of force**, the law that, fundamentally speaking, there are no forces in nature to which the law of energy does not apply; the principle that the total energy of the universe is constant, no energy being created or destroyed in any of the processes of nature, every gain or loss in one form of energy corresponding precisely to a loss or gain in some other form or forms. (See *correlation of energies*.) This is the great fundamental principle of modern physics; it was perhaps first enunciated by K. F. Mohr in 1837, though several physicists were independently led to its discovery. Those uniformities of nature which present phenomena of irreversible actions—such as friction and other resistances, the conduction of heat and the phenomena of the second law of thermodynamics in general, chemical reactions, the growth and development of organic forms, etc.—cannot, according to this doctrine, result from the laws of force alone, but are to be accounted for as statistical uniformities, due to vast numbers of fortuitously moving molecules. = *Syn.* 2. 2. [*ME. English, Engliſch*, etc., < *AS. Englisc, Engliſe*, neut. adj. as noun (also with a noun, *Engliſe gereord* or *getheod*), the English language—that is, the language spoken by the Angles and, by extension, by the Saxons and other Low German tribes who composed the people called Anglo-Saxons. See etymology above, *Anglo-Saxon*, and *def.*] The language of the people of England and of the peoples derived from them, including those of English descent in the United States of America, Canada, Australia, New Zealand, and the British dependencies in India, Africa, and other parts of the world. The signification of the term *English*, as applied to language, has varied with its changes of signification in political use. Originally applied to the language of the Angles, it came in time to be the general designation of the aggregate of slightly differing Low German dialects, Anglian and Saxon, which was recognized as the national tongue of the Teutonic invaders of Britain. This tongue, now

generally known as *Anglo-Saxon* (see *Anglo-Saxon*), underwent in the course of time, by the Scandinavian invasion in the ninth century, and by the Norman conquest and the introduction of Norman French in the eleventh century, changes so extensive and profound as to make the "English" language of the later periods practically another tongue. Accordingly, the older stages of the language have at different periods received some special designation, as *Saxon*, *Anglo-Saxon*, *English-Saxon*, or *Saxon-English* for the language before the Norman conquest, and *Old English* or *Early English* for the period between the Norman conquest and the modern period. Recently some British scholars have insisted on using *English* to cover the whole range of the language, applying *Old English*, or, as some term it, *Oldest English*, to the Anglo-Saxon period. But, apart from the question as to the practical differences of the Anglo-Saxon and the language later called *English*, this tends to confusion, the term *Old English* having long had a distinct and well-understood application to the mixed language developed after the Norman conquest. Various divisions have been made of the periods of English. All are more or less arbitrary, there being no absolute gap even between the Anglo-Saxon and the following period. A common division, adopted in this dictionary, is as follows: (1) *Anglo-Saxon*, meaning usually and chiefly West-Saxon, but including all other Anglo-Saxon dialects, Kentish, Mercian, Old Northumbrian, etc., from the middle of the fifth century, or rather from the seventh century, when the first contemporary records (in Anglo-Saxon) begin, to the middle or end of the twelfth century (A. D. 450 (600)–1150 (1200)); (2) *Middle English*, also called *Old English*, from the middle or end of the twelfth century to the beginning of the sixteenth century (A. D. 1150 (1200)–1500); (3) *Modern English*, or simply *English*, from the beginning of the sixteenth century to the present time. Each of these periods is divided, when convenient, into three subperiods by the terms *early* and *late* applied to the first and the last part of the main periods. The periods of transition cannot be exactly fixed, and in the etymologies of this dictionary the designation "early Middle English," for example, with reference to a word or form, may coincide in date with the designation "late Anglo-Saxon," as applied to another word or form of earlier aspect or spelling. So "early modern English," referring properly to the first part of the sixteenth century (A. D. 1500–1550), may in some cases refer back to the last decades of the fifteenth century, or, in regard to archaic forms and spellings, may extend to the date of the century or the date of the year is given. Philologically, English, considered with reference to its original form, Anglo-Saxon, and to the grammatical features which it retains of Anglo-Saxon origin, is the most conspicuous member of the Low German group of the Teutonic family, the other Low German languages being Old Saxon, Old Frisian, Old Low German, and other extinct forms, and the modern Dutch, Flemish, Frisian, and Low German (Platt Deutsch). These, with High German, constitute the "West Germanic" branch, as Gothic and the Scandinavian tongues constitute the "East Germanic" branch, of the Teutonic family. (See the terms used.) By mixture with the Celtic and Latin of the Anglo-Saxon period, and later with the kindred Scandinavian, and then with the Old French of the Norman and other dialects, especially with the Norman French as developed in England (the Anglo-French), and with later French, and finally, in consequence of the spread of English exploration, commerce, conquest, and colonization, with nearly all the other great languages of the globe, English has become the most composite language spoken by man. The vocabulary of common life is still about three fourths of Anglo-Saxon origin; but the vocabulary of literature and commerce contains a majority of words of foreign origin, chiefly Latin or Greek, coming in great part through the Romance tongues, and of these chiefly through French. The languages from which the next greatest contributions have been received are the Scandinavian (Icelandic, Swedish, Danish, Norwegian), the Low German (Dutch, Flemish, etc.), Celtic, Hebrew, Persian, Arabic, Hindustani, Turkish, Malay, Chinese, American Indian, etc. The words derived from the more remote languages are, however, in great part names of products or customs peculiar to the countries concerned, and few of them enter into actual English use.

All deviations by the cue-ball from such motion as would naturally result from a straight central stroke with the cue, or from the slant given by impact on the side of an object-ball after such a stroke, are governed by the same principle; but as most force-shots have special names (*draw*, *follow*, *massé*, etc.), the word *English* is generally used only when the ball glances after impact in a direction more or less sharply angular from the object-ball or cushion. engraving (en-grāv'ving), *n.* [Verbal *n.* of *engrave¹*, *v.*] 1. The act or art of cutting designs, inscriptions, etc., on any hard substance, as stone, metal, or wood. Many branches of the art, as gem-engraving, cameo-cutting, and die-sinking, are of great antiquity.

2. Specifically, the art of forming designs by cutting, corrosion by acids, a photographic process, etc., on the surface of metal plates or of blocks of wood, etc., for the purpose of taking off impressions or prints of the design so formed.

Wood-engraving appears to have come first into use, the earliest dated wood-engraving, representing St. Christopher, bearing the date of 1423, while the earliest engraving worthy of the name from a metal plate was produced by Maso Finiguerra, a goldsmith of Florence, in 1452. Relief-engraving on wood was, however, in use among the Orientals at a far earlier period. In engraving on metal the lines or marks which are to appear on the paper are sunk into the plate, and before being printed from are filled with ink, the rest of the surface being cleaned before the impression is taken. On a block of wood the lines for impression are left prominent, the blank parts being cut away, so that the wooden block serves as a type. Copper and steel plates are printed from separately on a press specially adapted for this use; wooden blocks, on the ordinary printing-press, commonly along with the accompanying text. The wood generally used for fine engraving is box, and the metals commonly employed by engravers are copper and steel. Different methods or styles of engraving on steel or copper are known as *aquatint*, *etching*, *mezzotint*, *stipple*, *line-engraving*, etc.

In facsimile engraving, . . . the drawing is made upon the wood with a pen or the point of a burish, generally by another person, and all that the engraver does is just to hollow all the little areas of wood that are left inkless.

P. G. Hamerton, *Graphic Arts*, p. 413.

3. That which is engraved, or produced by engraving; an engraved representation, or an incised plate or block intended to be printed from: as, an engraving on a monument or a watch-case; a steel or a wood engraving.

With the work of an engraver in stone, like the engravings of a signet, shalt thou engrave the two stones with the name of the children of Israel. Ex. xxviii. 11.

4. An impression taken from an engraved plate or block; a print.—**Anaglyptographic engraving**, **anastatic engraving**. See the adjectives.—**Bureau of Engraving and Printing**. See *bureau*.—**Chalk engraving**, a form of stipple engraving used to imitate drawings made in chalk. The grain of the chalk drawing is reproduced by irregular dots of different forms and sizes.—**Copperplate engraving**, the art of engraving on prepared plates of copper for printing. To the plate is given a surface which is perfectly plane and highly polished. It is next heated sufficiently to melt wax, with which it is then rubbed over, so that when cooled it is covered with a white skin, to which the design or drawing is transferred. The engraver, with a steel point, follows the lines of the drawing, pressing lightly so as to penetrate through the wax and line faintly the copper surface beneath. The wax is then melted off, the surface cleaned, and the engraving is proceeded with, a burin or graver being used to cut the lines, a scraper to remove the slight bur raised by the burin, and a burnisher to soften or tone down the lines and remove scratches. The engraver uses also a woolen rubber and a little olive-oil to clean the face of the plate, in order to render the condition of his work plainly visible; and this rubber serves also to polish off the burrs.—**Facsimile engraving**, engraving on wood, in which every line is either drawn on the block or else photographed from pen or pencil drawing in reduced size, the work of the engraver being to remove the wood from between these lines. This is the earliest method of wood-engraving, and is called *facsimile* in contradistinction to *tint engraving*, in which, the drawing being in wash,

ganche, or oil paint, the engraver has to invent the lines, which he cuts in such a manner as to render when printed the exact shades of the original drawing—a method of engraving of comparatively recent origin.—**Line-engraving**, the art, methods, etc., of engraving in incised lines on metal. Modern line-engravers frequently begin by etching, and complete their work with the dry-point and the burin. After the design has been transferred to the etching-ground, and the parts to be bitten in, such as grass, foliage, sea-waves, and the flowing lines of draperies, have been drawn with the needle, all white objects, such as drapery, satin, clouds, etc., the light parts of water, etc., are stopped out, to preserve them from the corroding acid. A ruling-machine, consisting of a straight bar of steel with a sliding socket having a perpendicular tube containing a diamond-pointed pen attached to its side, is used to lay flat tints, such as clear-blue skies, in parallel lines, either straight or curved, as the shape of the object to be represented may demand. When the plate has been bitten in, the ground is removed and the unbitten parts are engraved with the burin. This instrument is handled in various ways, according to the texture of the object under treatment, as by cross-hatchings, undulating or straight lines, dots in lozenge-shaped or square spaces formed by the intersection of lines, etc.; care being taken to avoid sameness of stroke, and to give as much variety as possible to the necessarily more or less mechanical patterns produced by a stiff unyielding instrument.—**Photographic engraving**, any method of engraving in which an application of photography is a chief factor in the production of the block or plate from which the impressions are taken.—**Photo-intaglio engraving**, any process for producing lines on a plate by photography, and subsequently etching them in.—**Process engraving**, a name often given to photographic engraving. Also called *process*. (See also *etching*, *heliotypy*, *lithography*, *mezzotint*, *photo-engraving*, *photogravure*, etc.)

The engrossing-hand of the present day is a fair round hand, purposely made as legible as possible. ensemble (F. pron. on-som'bl), n. [F., < ensemble, together: see ensemble, adv.] 1. The union of parts in a whole; all the parts of anything taken together, so that each part is considered only in relation to the whole; specifically, the general effect of a work of art, piece of music, drama, etc.—2. In music, the union of all the performers in a concerted composition, as in a chorus with full orchestral accompaniment.—3. In math., a manifold or collection of elements, discrete or continuous, finite, infinite, or superinfinite. The elements of the ensemble are usually termed its points. The integrant parts of an ensemble are all the other ensembles whose elements are elements of it. Two ensembles whose elements are capable of being put into a one-to-one correspondence with one another are said to have the same value or to be equivalent. The first value is the smallest infinite value, or that of the ensemble of positive whole numbers. A linear ensemble is one whose elements can be brought into correspondence each with a different point of one line. A derived ensemble is one which consists of all the limits of elements in a primitive ensemble. An ensemble is said to be condensed within a certain interval if there are elements of the ensemble in every part of the interval, however small. Disconnected ensembles are ensembles which have no common element. A definite ensemble is an ensemble such that every object is either determined to be an element of it or determined not to be so, and no object is determined in both ways. An ordered ensemble

is one in which the elements have a definite succession. A *perfect ensemble* is one which is its own derived ensemble. See *number*.—**First genus of ensembles**, that class of ensembles which have only a finite number of successive derived ensembles, since the elements of the *n*th derived ensemble have no limits.—**Second genus of ensembles**, that class of ensembles which have an infinite succession of derived ensembles.—**Tout ensemble**, the entire combination or collocation; the assemblage of parts or arrangement of details viewed as a whole; as, the *tout ensemble* of the piece is admirable.

This method has been practised in some countries from very early times, and has been recommended by modern agriculturists. Brick-lined chambers are often used to modern practice, having a movable wooden covering upon which is placed a heavy weight, say half a ton to the square yard. The pits or chambers are constructed in such a way as to exclude the air as far as possible.

It is not the least of the recommendations of the new process of preserving green fodder, called *ensilage*, that

the exclusion of oxygen is an essential feature in it, fire-risks being thus avoided.

W. L. Carpenter, *Energy in Nature* (1st ed.), p. 79.

One of the earliest of Latin writers refers to subterranean vaults (silos), wherein the ancient Romans preserved green forage, grain, and fruit, and the Mexicans have practised the system for centuries. 3. In *law*: (a) The limitation of land to certain members of a particular family or line of descent; a prescribed order of successive inheritances, voluntarily created, to keep land in the family undivided; the rule of descent settled for an estate.

He (Walpole) scoffed at . . . the practice of entail, and tasked the ingenuity of conveyancers to tie up his villa in the strictest settlement.

Macaulay, Horace Walpole.

(b) An estate entailed or limited to particular heirs; an estate given to a man and his heirs. The word is now, however, often loosely used, since strict entails are obsolete, to indicate the giving of property to one or to two successively for life with suspension of power of alienation meanwhile. By early English law, as fully established under the Norman conquest, a feoffment or grant of land to "A and the heirs of his body" created an entail, so that neither A nor any successive heir taking under the grant could alien the land; and if the line of heirs

failed, the land reverted to the lord who made the grant, or his heirs. In course of time the inconveniences of the restriction on alienation led the courts to hold that such a gift must be understood not as a gift to the heirs after A, but to A on condition that he should have heirs; in other words, that the heirs could not claim as donees under the feoffment, but only as heirs under A, and that hence A took a fee, which, if he had heirs of his body, became absolute, and enabled him to alien the land. This practical abolition of entails by the courts was followed by the statute of Westminster of 1285, known as the *statute de Donis Conditionalibus*, which enacted that the will of the donor in such gifts according to the form manifestly expressed should be observed, so that such a grantee should have no power to alien. Under this act, which re-established entails, a large part of the land in England was fettered by such grants. The courts, still disfavoring entails, termed the estate thus granted a fee tail (see *tail*), and sustained alienations by the tenant in tail, subject, however, to the right of the heirs in tail, or, if none, of the lord, to enter on the death of the tenant who had conveyed. (See *base fee*, under *fee*.) They subsequently also sanctioned absolute alienations by allowing the tenant in tail to have an action brought against him in which he collusively suffered the plaintiff to recover the land. (See *fine*, *recovery*, and *Taltarum's case*, under *case*.) In 1833 a direct deed was substituted by statute for this fiction. The object of entails is now, to some extent, secured by family or marriage settlements, which are often, but inaccurately, spoken of as if effecting entails. In most if not all of the United States, and in Canada, entails have been abolished, either as in England or by statutes declaring that words which would formerly create an entail create a fee simple, or, as in some States, a life estate with remainder in fee simple to heirs.—**Quasi entail**, an entail of an estate less than a fee, such as an estate for the life of a third person.—**Statute of entail**, a name sometimes given to the statute de Donis Conditionalibus (which see, above).—**To bar an entail, to dock an entail**, to defeat the restrictions of an entail by aliening or resettling the land.

The entasis is designed both to counteract the optical illusion which would cause the profiles of the shafts to appear curved inward if they were bounded by straight lines, and to give the

entelechy (en-tel'e-ki), *n.* [< L. *entelechia*, < Gr. *ἐντελέχεια*, actuality, < *ἐν* *τέλει* *ἔχειν*, be complete (cf. *ἐντελής*, complete, full): *ἐν*, in; *τέλει*, dat. of *τέλος*, end, completion; *ἔχειν*, have, hold, intr. be.] Realization: opposed to *power* or *potentiality*, and nearly the same as *energy* or *act* (actuality). The only difference is that *entelechy* implies a more perfect realization. The idea of *entelechy* is connected with that of form, the idea of power with that of matter. Thus, iron is potentially in its ore, which to be made iron must be worked; when this is done, the iron exists in *entelechy*. The development from being in posse or in germ to *entelechy* takes place, according to Aristotle, by means of a change, the imperfect action or energy, of which the perfected result is the *entelechy*. *Entelechy* is, however, either first or second. *First entelechy* is being in working order; *second entelechy* is being in action. The soul is said to be the first *entelechy* of the body, which seems to imply that it grows out of the body as its germ; but the idea more insisted upon is that man without the soul would be but a body, while the soul, once developed, is not lost when the man sleeps. Cudworth terms his plastic nature (which see, under *nature*) a first *entelechy*, and Leibnitz calls a monad an *entelechy*.

To express this aspect of the mental functions, Aristotle makes use of the word *entelechy*. The word is one which explains itself. Frequently, it is true, Aristotle fails to draw any strict line of demarcation between *entelechy* and *energy*; but in theory, at least, the two are definitely sep-

arated from each other, and *ἐντελέχεια* represents merely a stage on the path toward *ἐντελέχεια*. *Entelechy* in short is the realization which contains the end of a process: the complete expression of some function—the perfection of some phenomenon, the last stage in that process from potentiality to reality which we have already noticed. Soul then is not only the realization of the body; it is its perfect realization or full development.

E. Wallace, *Aristotle's Psychology*, p. xlii.

It is one of the slow or sedate monkeys, having little of the restlessness characteristic of most of the tribe, and is of moderate size, yellowish color, reddening on the limbs, with black hands and feet and blackish face. The most conspicuous feature is the cap of fur radiating from the top of the head, and peaked over the eyebrows, with full whiskers and beard on the cheeks and chin. orable and exalted motives or ideas, whether correct or erroneous.

If there be any seeming extravagance in the case, I must comfort myself the best I can, and consider that all sound love and admiration is *enthusiasm*: the transports of poets, the sublime of orators, the rapture of musicians, the high strains of the virtuosos, all mere *enthusiasm*! Even learning itself, the love of arts and curiosities, the spirit of travellers and adventurers, gallantry, war, heroism—all, all *enthusiasm*! *Shaftesbury*, The Moralists, III. § 2.

[Before the introduction of porter in the first quarter of the eighteenth century, the chief malt liquors in Great Britain were ale, beer, and twopenny. A good deal of trouble was caused by demands for mixtures of these. At last a brewer hit upon a beverage which was considered to combine the flavors of these three, and which was called *entire*, as being drawn from one cask. As it was much drunk by porters and other working people, it also received the name of *porter*. Butler, Hudibras, I. 1. 145.

When first thou gav'st the promise of a man,
When th' embryon spark of *entity* began. *Hart*.

2. An independent *ens*; a thing; a substance; an ontological chimera. As a concrete noun, it is chiefly used to express the current notion of the mode of being attributed by scholastic metaphysicians to general natures and to formalities. Modern writers have generally said the schoolmen made *entities* of words, a judgment which seems to espouse the nominalistic side of the great dispute, although the writers who use this phrase are not decided nominalists. Such being the connection which by its associations gives the word *entity* its meaning, the latter is necessarily vague.

The schools have of late much amused the world with a way they have got of referring all natural effects to certain *entities* that they call real qualities, and accordingly attribute to them a nature distinct from the modification of the matter they belong to, and in some cases separable from all matter whatsoever. . . . Aristotle usually calls substances simply *ousia*, *entities*.

Boyle, Origin of Forms (Works, 2d ed., III. 12, 16).

The realists maintained that general names are the names of general things. Besides individual things, they recognised another kind of things, not individual, which they technically called second substances, or universals a parte rei. Over and above all individual men and women there was an *entity* called Man—Man in general, which inhered in the individual men and women, and communicated to them its essence.

J. S. Mill, Exam. of Hamilton, xvii.

The scientific acceptance of laws and properties is quite as metaphysical as the scholastic acceptance of *entities* and quiddities; but the justification of the one set is their objective validity, i. e. their agreement with sensible experience; the illusoriness of the other is their incapability of being resolved into sensible concretes.

G. H. Lewes, Probs. of Life and Mind, I. 1. § 62.

There is scarcely a less dignified *entity* than a patrician in a panic. *Disraeli*.

The foremost men of the age accept the ether not as a vague dream, but as a real *entity*.

Will is essentially a self-procreating, self-sustaining, spiritual *entity*, which owns no natural cause, obeys no law, and has no sort of affinity with matter.

Maudsley, Body and Will, p. 1.

These mollusks are still imperfectly known, but are supposed to be nudibranchs. *E. mirabilis* is an internal worm-like parasite of *Synapta digitata*, with one end hanging free in the body-cavity of *Synapta*, the other attached to the alimentary canal of the host, and contained in what is called the molluskigerous sac occasionally found in *Synapta*. The eggs develop a velum and an operculated shell, found free in the body-cavity of the host, whence the name. *E. muelleri* is another species of the genus, found in the trepang, *Holothuria edulis*.

It consists in the growth of a bud from the gastric cavity, into which it eventually passes on its way outward; while in all other cases gemination takes place by the formation of a diverticulum of the whole wall of the gastrovascular cavity, which projects on the free surface of the body, and is detached thence (if it becomes detached) immediately into the circumjacent water. See *allogenesis*.

The details of this process of *entogastric gemination* have been traced by Haeckel in *Carmarina hastata*, one of the *Geryoniidae*. . . . What makes this process of asexual multiplication more remarkable is that it takes place in *Carmarina* which have already attained sexual maturity, and in males as well as in females. *Huxley, Anat. Invert., p. 135.*

5. In *geom.*, a curve or surface touching a continuous series of curves or surfaces. Thus, suppose a plane curve to undergo a continuous change in its shape and position; then the curve as it is at any instant is intersected by the curve as it is at any subsequent instant, and the closer the second instant follows after the first the closer do these intersections approach certain positions on the first curve. These positions are points on the envelop, and in this way all the points on the envelop are determined. If *t* is a variable parameter, and *P* = 0 is the equation of the surface, then the equation obtained by eliminating *t* between *P* = 0 and *dP/dt* = 0 is the equation to the envelop. Or if there are two variable parameters, *s* and *t*, the equation of the envelop is obtained by eliminating them between *P* = 0, *dP/ds* = 0, and *dP/dt* = 0. Every curve may thus be regarded as an envelop. Caustics, evolutes, etc., are so by their definitions.—**Floral envelop**, the perianth of a flower.—**Stamped envelop**, an envelop imprinted with a postage-

Sometimes the blanks are first cut to shape in a separate machine. The capacity of a good machine is estimated at 120 envelopes a minute, or 72,000 in one day.

To regard with envy; look upon as the possessor of what is wanting in or to one's self, with a longing for it, and either with or

without a desire for the deprivation or disfigurement of him who has it: often with both the possessor and the thing possessed as objects. The verb often expresses a much milder feeling than that which is usually denoted by the noun — one that may be consistent with perfect friendship and loyalty: as, *I envy you your good health; I envy you your happy temper.* But the feeling of envy is apt to beget repugnance and ill will, and some degree of these qualities is generally implied by the verb as well as by the noun.

eon, æon (ē'on), *n.* [*< LL. æon* (def. 2), < Gr.
αἰών, a period of existence, an age, a lifetime,
a long space of time, eternity, later in philos.
an *eon* (def. 2) = L. *ærum*, OL. *æron*, a space
of time, an age, = Goth. *aiws*, an age, a long
period: see *ayl*, *ayc*¹, *age*, *etern*.] 1. A long
space of time; a secular period, either indefi-
nite or limited to the duration of something, as
a dispensation or the universe: used as equiv-
alent to *age*, *era*, or *cycle*, and sometimes to
eternity.

Then a scratch with the trusty old dagger . . . will save
. . . me from any more philosophic doubts for a few *æons*
of ages, till we meet again in new lives.

Kingsley, Hypatia, xxi.

Where, *æons* ago, with half-shut eye,
The sluggish saurian crawled to die.

Lowell, Pictures from Appledore.

Out of the deep,
Where all that was to be, in all that was,
Whirl'd for a million *æons* thro' the vast
Waste dawn of multitudinous-eddy light.

Tennyson, De Profundis.

The rigidity of old conceptions has been relaxed, the
public mind being rendered gradually tolerant of the idea
that not for six thousand, nor for sixty thousand, nor for
six thousand thousand, but for *æons* embracing untold
millions of years, this earth has been the theatre of life
and death.

Tyndall.

2. In *Platonic philos.*, a virtue, attribute, or
perfection existing throughout eternity. The
Platonists represented the Deity as an assemblage of *æons*.
The Gnostics considered *æons* as certain substantial powers
or divine natures emanating from the Supreme Deity, and
performing various parts in the operations of the universe.

eonian, æonian (ē-ō-ni'an), *a.* [*< Gr. αἰώνιος*,
lasting for an age, perpetual, eternal, < *αἰών*, an
age: see *eon*.] Lasting for *æons* or ages; ever-
lasting. [Poetical.]

Streams that swift or slow
Draw down *Æonian* hills, and sow
The dust of continents to be.

Some sweet morning yet, in God's
Dim *æonian* periods,
Joyful I shall wake to see
Those I love who rest in Thee.

Waltier, Andrew Rykman's Prayer.

In *Gr. myth.*, the goddess of the dawn, who brings up the rosy light of day from the east: same as the Roman *Aurora*. She was represented in art and poetry as a young and beautiful winged maiden.

C. O. Müller, *Manual of Archaeol.* (trans.), § 400.

2. [NL.] A genus of lories, by some ranked only as a section of *Domicella*, containing several species, as *E. histrio*, *E. rubra*, *E. cardinalis*, etc. *Wagler*, 1832.

eosin (ē'ō-sin), *n.* [*Gr. ἥως, dawn, + -in².*] Tetrabromfluorescein ($C_{20}H_8Br_4O_5$), a valuable dye derived from coal-tar products, forming red or yellowish-red crystals. It forms a potassium salt, the eosin of commerce, which is a brown powder, soluble in water, and dyes silk and woolen goods rose-red. Also *eosinic acid*.

If a transpiring branch be placed in a solution of *eosin*, the colour, as is well known, gradually spreads over the whole specimen, so that the leaves become discoloured and the wood of the smallest twigs shows a bright pink colour.

Proc. of Cambridge Phil. Soc., V. v. 358.

eosphorite (ē-os'fō-rīt), *n.* [So called in allusion to its pink color; < *Gr. εὐσφῆρος, bringing the dawn* (used as a name of the morning star; cf. *Lucifer* and *phosphorus*) (< *ἠώς, ἥως, dawn, + -φῆρος, < φέρειν = E. bear¹, + -ite².*] A hydrous phosphate of aluminium and manganese, with a small amount of iron. It occurs in prismatic crystals and cleavable masses, usually of a delicate rose-pink color. It is closely related to childerite, which, however, contains chiefly iron with but little manganese.

Eotherium (ē-ō-thē'ri-um), *n.* [NL., < *Gr. ἥως, dawn, + θῆριον, a wild beast.*] A genus of fossil sirenians, founded upon the east of a brain from nummulitic limestone of Eocene age, in Egypt, near Cairo. *E. aegyptiacum* is notable as the oldest known form of the *Sirenia*.

-eous. [See *-ous*, *-aceous*, and the words mentioned below.] A termination consisting of *-ous* with a preceding original or inserted vowel. Compare *-ious*. It occurs in *cretaceous*, *seabeous*, etc. (See *-aceous*.) In some words it is a false spelling of *-ious*, as in *calcareous* (Latin *calcareus*), *beauteous*, *duteous* (properly *beautious*, *dutious*); in *hideous* it is a substitute for *-ous*, and in *gorgeous* an accommodation of a different termination. In *righteous*, and the occasional *wrongeous*, *wrongous*, it is a perversion of the original *-ivus*. See the words mentioned.

eozoic (ē-ō-zō'ik), *a.* [*Gr. ἥως, dawn, + ζῷον, life.*] Of or pertaining to the oldest fossiliferous rocks, such as the Laurentian and Huronian of Canada, from the supposition that they contain the first or earliest traces of animal life; paleozoic.

Eozoön (ē-ō-zō'ōn), *n.* [NL., < *Gr. ἥως, dawn, + ζῷον, animal.*] A name given in 1865 by the geologists of the Canada survey to a certain aggregate of minerals, viewed by them as a fossilized organic body, belonging to the *Foraminifera*. The best-characterized specimens of so-called *Eozoön* exhibit on the polished surface to the naked eye alternating bands of grayish and greenish color. These bands, which are generally from one to four tenths of an inch in thickness, vary considerably as regards the regularity of their occurrence, and between them are frequently seen layers of a mineral made up of fine parallel fibers. The whitish mineral is usually calcite; the greenish, serpentine; and the fibrous bands are the variety of

serpentine called chrysotile. Microscopic examination has shown that the whole is an alteration-product of various minerals. The calcite has frequently running through it, and grouped in a great variety of ways, branching forms, which were supposed by the advocates of the foraminiferal nature of the *Eozoön* to represent the canal-system of that form of organisms. This same structure has, however, been frequently observed in minerals forming part of rocks of undoubted igneous origin, as well as in those occurring as veinstones, and there can no longer be any doubt as to the inorganic nature of the *Eozoön*. This supposed foraminifer, having been found in rocks called at that time Azoic, and later Archean, was believed to be the oldest recognized organic form, and to represent the "dawn of life"; hence the generic name. The supposed species was called *E. canadense* by J. W. Dawson.

eozoönal (ē-ō-zō'ōn-əl), *a.* [*Gr. Eozoön + -al.*] Pertaining to or characterized by the supposed fossil called *Eozoön*: as, *eozoönal structure*.

Science, IV. 327.

Eozoönina (ē-ō-zō'ōn-ī-nā), *n. pl.* [NL., < *Eozoön + -ina.*] A group of supposed foraminifers, represented by *Eozoön*, whose tests form irregular or acervuline adherent masses. Also *Eozoöninae*, as a subfamily of *Nummulinidae*.

ep- The form of *epi-* before a vowel.

ep. A common abbreviation of *epistle*.

epacrid (ep'a-krid), *n.* A member of the order *Epacridaceæ*.

Certain acacias, *epacrids*.

Encyc. Brit., IX. 156.

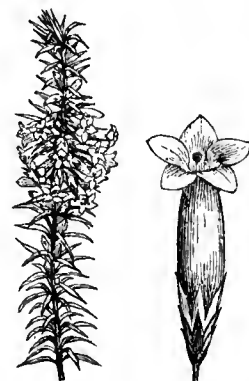

Epacridaceæ (ep'a-kri-dā'sē-ē), *n. pl.* [*Gr. Epacris (-id-) + -aceæ.*] A natural order of monopetalous exogens, very closely allied to the *Ericaceæ*, but distinguished by one-celled, unapendaged anthers opening by a longitudinal slit. There are about 25 genera and over 300 species, natives of Australia and the Pacific islands, with a single species on the western coast of Patagonia. The largest genus is *Leucopogon*, some species of which bear edible berries. The order contains many very ornamental species, sparingly represented in greenhouses.

Epacris (ep'a-kris), *n.* [NL., so called in allusion to the terminal spikes of the flowers (cf.

Gr. ἐπᾶκρος, on the heights), < *Gr. ἐπί, upon, + ἄκρον, top, summit: see acro-*] The typical genus of the order *Epacridaceæ*, of 25 shrubby, heath-like species, mostly Australian. From the abundance and beauty of their flowers, which are generally in leafy spikes, several species have been favorites in cultivation.

epact (ē'pakt), *n.* [*Gr. ἐπᾶκτη, the epact, pl. ἐπᾶκται (sc. ἡμέραι), intercalary days, fem. of ἐπᾶκτός, brought in, intercalated, adscititious, < ἐπάγειν, bring in or to, add, intercalate, < ἐπί, to, + ἀγειν = L. agere, bring, lead: see act, etc.*] 1. The excess of a solar over a lunar year or month.

Hence, usually—2. A number attached to a year by a rule of the calendar to show the age, in days completed and commenced, of the calendar moon at the beginning of the year—that is, on January 1st in the Gregorian, Victorian, and early Latin calendars, or March 22d in the Dionysian calendar, or old style. A rule for the epact has been attached to every calendar of the Western churches, except the German Evangelical calendar of A. D. 1700–1779. The epact usually increases by 11 from one year to the next, 30 being subtracted from the sum when the latter exceeds 30 (a circumstance which indicates 13 new moons in the year); but in some years the increase is 12 instead of 11, and this is called a leap of the moon. In the Gregorian calendar the increase is sometimes only 10. In the earliest calendars the leaps of the moon took place every 12 years, and later every 14; but since the adoption of the Victorian calendar in the fifth century, they have taken place every 19 years. To find the epact in old style, divide the number of the year by 19, take 11 times the remainder after division, divide the product by 30, and the remainder after this division is the epact. When there is no remainder, some chronologists make the epact 29, but 30 is preferable. This epact shows the age of the calendar moon on March 22d, by means of which the age on every other day can be calculated, by allowing alternately 29 and 30 days to a lunation. This would also agree with the age of the mean moon were the calendar perfect. The intercalary day of leap-year necessarily removes the calendar moon one day from the mean moon in certain years; and the error of the 19-year period accumulates to one day every 310 years, so that to approximate more closely to the age of the moon the epact should

Flowering Branch of *Epacris impressa*, with flower on larger scale.

be increased by 2 for every 300 years from the middle of the fifth century. It should also be increased by 1 for leap-years and years following leap-year. The Gregorian epact exceeds the Dionysian by 1 in the sixteenth and seventeenth centuries, agrees with it in the eighteenth and nineteenth centuries (but instead of 30 an asterisk, *, is written), and falls short of it by 1 in the twentieth and twenty-first centuries. This irregularity is because the Gregorian epact receives a solar correction, being a deduction of 1, at the advent of every century-year not a leap-year, and a lunar correction, being an addition of 1, every 300 years beginning with A. D. 1800 until seven such corrections have been applied, when 400 years elapse before a new series of seven corrections commences. This is called the *cycle or period of epacts*. The Gregorian epact shows the age of the calendar moon on January 1st. This will rarely differ by more than one day from the real moon.—**Annual epact**, the excess of the Julian solar over the lunar year of 12 lunations, being 10.9 days.—**Astronomical epact**, the epact in sense 1.—**Embolismic epact**, an epact exceeding 18, so that that of the following year will be less or *.—**Epact of a day**, the age of the calendar moon on that day.—**Gregorian epact**, the epact of the Gregorian calendar.—**Julian epact**, a number showing the age of the Gregorian calendar moon on January 1st in the old style.—**Menstrual epact**, the excess of a civil calendar month over a synodical month, or the amount by which the moon is older at the end than at the beginning of the calendar month.

epagoge (ep-a-gō'jē), *n.* [*Gr. ἐπαγωγή, induction, < ἐπάγειν, lead to, bring on, add: see epact.*] 1. Induction; more loosely, in *rhet.*, proof by example; argumentation from a similar case or cases, or by contrast with dissimilar cases; rhetorical induction. Extended or strict induction is not feasible in oratory, as it would weary instead of convincing. See *example* and *paradigm*.

2. [*cap.*] [NL.] In *entom.*, a genus of lepidopterous insects. *Hübner*.

epagogic (ep-a-gōj'ik), *a.* [*Gr. epagoge + -ic.*] Pertaining to induction.

An example of epanalepsis is found in 1 Cor. xi: "(v. 18) When ye come together in the church, I hear that there be divisions among you. . . (v. 20) When ye come together therefore into one place, this is not to eat the Lord's supper."

epanaphora (ep-a-naf'ō-rā), *n.* [L., < *Gr. ἐπαναφορά, a reference, repetition, < ἐπαναφέρειν, bring back again, refer, < ἐπί + ἀναφέρειν, bring back: see anaphora.*] In *rhet.*, a figure by which the same word or group of words is repeated at the beginning of two or more clauses, sentences, or verses in immediate succession or in the same passage. This figure is very frequent in the Book of Psalms; as, for example, in the twenty-ninth Psalm, the phrase "Give unto the Lord" is used three times in the first two verses, and the phrase "The voice of the Lord" occurs seven times in verses 3–9. Similarly, the words "by faith" or "through faith" (both renderings representing the one Greek word, πίστις) begin eighteen out of twenty-nine verses in Heb. xi. The name *epanaphora* is retained when synonyms or words of similar meaning are substituted for the word or words to be repeated: as, "Praise the Lord, all ye Gentiles; and laud him, all ye people," Rom. xv. 11. The converse of epanaphora is *epiphora*. Also called *anaphora*, and sometimes *epibole*.

epanastrophe (ep-a-nas'trō-fē), *n.* [NL., < *Gr. ἐπαναστροφή, a return, repetition of a word at the opening of a sentence, < ἐπαναστρέφειν, return, < ἐπί + ἀναστρέφειν, turn back: see anastrophe.*] In *rhet.*, a figure by which a word or

phrase which ends one clause or sentence is immediately repeated as the beginning of the next: same as *anadiplosis*.

epanodos (e-pān'-ō-dos), *n.* [NL., < Gr. *ἐπανάδος*, a rising up, a return, recapitulation, < *ἐπί*, upon, to, + *ἀνάδος*, a way up: see *anode*.] In rhet.: (a) Recapitulation of the chief points or heads in a discourse; enumeration; especially, recapitulation of the principal points in an order the reverse of that in which they were previously treated, recurring to the last point first, and so returning toward the earlier topics or arguments. (b) Repetition of names or topics singly, with further discussion or characterization of each, after having at first merely mentioned or enumerated them.

epanody (e-pān'-ō-di), *n.* [Gr. *ἐπανάδος*, a return: see *epanodos*.] In bot., the reversion of an abnormally irregular form of flower to a regular form.

A shoulder-piece; an ornamental badge worn on the shoulder; specifically, a strap proceeding from the collar, and terminating on the shoulder in a disk, from which depends a fringe of cord, usually in bullion, but sometimes in worsted or other material, according to the rank of the wearer, etc. Epaulets were worn in the British army until 1855, and are still worn in the navy by all officers of and above the rank of lieutenant, and by some civil officers. They were worn by all officers in the United States army until 1872; since that time only general officers wear them; all other commissioned officers wear shoulder-knots of gold bullion. All United States naval officers above the grade of ensign wear epaulets. In the French army the private soldiers wear epaulets of worsted. See *shoulder-strap*, *shoulder-knot*.

epaulment, epaulement (e-pāl'ment), *n.* [F. *épaulement*, < *épauler*, shoulder, support, protect by an epaulment, < *épaule*, the shoulder: see *epaule*.] In fort., originally, a mass of earth raised for the purpose either of protecting a body of troops at one extremity of their line, or of forming a wing or shoulder of a battery to prevent the guns from being dismounted by an enfilading fire. The term is now, however, used by the artillery arm of the service to designate the whole mass of earth or other

material which protects the guns in a battery both in front and on either flank; and an epaulment can be distinguished from a parapet only by being without the banquettes or step at the foot of the interior side on which the men stand to fire over a parapet. Its application includes the covering mass for a mortar-battery, also the mass thrown up to screen reserve artillery.

The *Ephemerida*, weak as it is individually, maintains itself in the world by its prolificacy. Brooks and ponds are richly populated with their young, and through the summer, when they come to maturity and take their flight, these delicate beings appear in immense numbers. They rise from the waters of our great inland lakes, fall a rapid prey to the waves, and are washed ashore in enormous quantities, their dead bodies forming windrows, comparable in extent with the sea-wrack of oceanic shores. They settle down in clouds in the streets of the lake cities, obscuring the street-lamps, and astonishing the passer-by. *Stand. Nat. Hist.*, II. 152.

In Christian times Ephesus became noted as a center of St. Paul's work in Asia Minor (one of his epistles also being inscribed "to the Ephesians"), as one of the seven

churches of the Apocalypse, and as the residence and death-place of St. John, after whom a modern village on the site is called *Atasuluk* (that is, Ἁγίος Θεόλογος, the Holy Divine). It had the title of apostolic see, and its metropolitan had a rank nearly equal to that of patriarch, till overshadowed by the rise of the patriarchate of Constantinople. It was also the scene of a number of ecclesiastical councils, one of them ecumenical. Also *Ephesine*.—**Ephesian Artemis**. See *Diana*.—**Ephesian or Ephesine Council**, any one of the several church councils held at Ephesus, the earliest of which met in A. D. 136 to settle a dispute as to the time of keeping Easter; especially, the third general or ecumenical council, held at Ephesus A. D. 431, under the emperors Theodosius II. and Valentinian III., the most prominent member of which was St. Cyril, patriarch of Alexandria. It deposed Nestorius, patriarch of Constantinople, and condemned his teaching as to the person of Christ. (See *Nestorianism*.) It also decreed that no bishop should subject to himself any ecclesiastical province which had not from the beginning been under the authority of his predecessors, and that any province so subjected should be restored, and the original rights of each province always remain inviolate.—**Ephesian or Ephesine Laetocinium**, a Eutychian council which met at Ephesus A. D. 449. It claimed to be ecumenical, but all its acts were annulled at the Chalcedonian council, A. D. 451. See *Laetocinium*.—**Ephesian or Ephesine liturgies**, *Ephesine class*, *family*, or *group* (of liturgies), the group or class to which the ancient liturgies of Gaul and Spain belong, and probably those of Britain also. The original or typical form represented by the various extant offices of this family is called the *Ephesine liturgy*. The connection of this type of office with Ephesus is a matter of inference. It is also sometimes called the *liturgy of St. Paul* or of *St. John*. See *Gallican*.

It includes a few marine fishes, among which the most notable are the species of *Chaetodipterus*, as *C. faber*, of the Atlantic coast of the United States, known in the markets of Washington and Baltimore as the *porgy*, but not to be confounded with the *porgy* of New York. See *cut* under *Chaetodipterus*.

In *branchiopods*, as *Daphnia*, an altered part of the carapace, of a saddle-shaped figure, representing a large area over which both inner and outer layers of the integument have acquired a brownish color, more consistency, and a peculiar texture. It is an alteration due to the development of that kind of egg known as *ephippial*.

When the next moult takes place, these altered portions of the integument, constituting the *ephippia*, are cast off, together with the rest of the carapace, which soon disappears, and then the *ephippium* is left, as a sort of double-walled spring box (the spring being formed by the original dorsal junction of the two halves of the carapace) in which the *ephippial ova* are enclosed. The *ephippium* sinks to the bottom and, sooner or later, its contents give rise to young *Daphniae*.

On each shoulder was fixed an onyx stone set in gold and engraved with the names of six of the tribes of Israel, and just above the girdle was fixed the breastplate of judgment. (See *Ex. xxviii. 6-12*.) In later times the ephod was not worn exclusively by the high priest, but when worn by others, as priests of lower rank, it was usually made of linen.

Shak., A. and C., II. 1.

II. *n.* 1. A follower of Epicurus, the great sensualistic philosopher of antiquity (341–270 B. C.), who founded a school at Athens about 307 B. C. He held, like Bentham, that pleasure is the

only possible end of rational action, and that the ultimate pleasure is freedom from disturbance. In logic the Epicureans are distinguished from all the other ancient schools, not only in maintaining an experiential theory of cognition and the validity of inductive reasoning, but also in denying the value of definitions, syllogism, and the other apparatus of the a priori method. Like J. S. Mill, they based induction upon the uniformity of nature. Epicurus was very strenuous in the advocacy of natural causes for all phenomena, and in resisting hypotheses of the interference of supernatural beings in nature. He adopted the atomistic theory of Democritus, while bringing into it the doctrine of chance, which is the very life of that theory. His views were thus more like those of a modern scientist than were those of any other philosopher of antiquity. Owning, however, to the natural repugnance to doctrines seeming to lower the nature of man, Epicurus and his school have been much hated and abused; so that an Epicurean has come to mean also a mere votary of pleasure. See 2.

I know it, and smile a hard-set smile, like a stoic, or like A wiser epicurean, and let the world have its way.
Tennyson, *Maud*, iv. 4.

2. [*cap.* or *l. c.*] A votary of pleasure, or one who pursues the pleasures of sense as the chief good; one who is fond of good living; a person of luxurious tastes, especially in eating and drinking; a gourmet; an epicure.

epicycle (ep'i-si-kl), *n.* [*ME. episcycle*, < LL. *epicyclus*, < Gr. *ἐπικυκλος*, *epikyklos*, < *ἐπί*, upon, + *κύκλος*, circle: see *cycle*.] 1. A circle moving upon or around another circle, as one of a number of wheels revolving round a common axis. See *epicyclic train*, under *epicyclic*.—2. In the Ptolemaic system of astronomy, a little circle, conceived for the explanation of planetary motion, whose center was supposed to move round in the circumference of a greater circle; a small circle whose center, being fixed in the deferent of a planet, was supposed to be carried along with the deferent, and yet by its own peculiar motion to carry the body of the planet fastened to it round its proper center. Copernicus also

made use of epicycles, which, however, were banished by Kepler.

The moone moevyth the contrarie from othere planetes as in hire *episcycle*, but in non other manere.

Chaucer, *Astrolabe*, ii. § 35.

The same phenomena in astronomy are satisfied by the received astronomy of the diurnal motion, and the proper motions of the planets, with their eccentricities and epicycles.
Bacon, *Advancement of Learning*, ii. 179.

Tycho hath feigned I know not how many subdivisions of epicycles in epicycles, &c., to calculate and express the moon's motion.
Burton, *Anat. of Mel.*, p. 297.

Cf. *epicycle* and *cyloid*.] In *geom.*, a curve generated by the motion of a point on the circumference of a circle which rolls upon the convex side of a fixed circle. These curves were invented by the Danish astronomer Roemer in 1674.—**Elliptic epicycloid**, a curve of the fourth order traced by a point in the plane of an ellipse which rolls upon an equal fixed ellipse.—**Exterior epicycloid**, an epicycloid proper, opposed to an interior epicycloid, which is a hypocycloid.—**Interior epicycloid**, a hypocycloid.—**Parabolic epicycloid**, the locus of a point upon the plane of a parabola which rolls upon an equal fixed parabola.—**Spherical epicycloid**, the locus of a point on the plane of a circle which rolls upon another circle so that the two planes have a constant inclination to each other.

It is used for converting circular into alternate motion, or alternate into circular. While the revolution of the smaller wheel is taking place, any point whatever on its circumference will describe a straight line, or will pass and repass through a diameter of the circle, once during each revolution. In practice a piston-rod or other reciprocating part may be attached to any point on the circumference of the smaller wheel.

A disease is said to be epidemic in a community when it appears in a great number of cases at the same time in that locality, but is not permanently prevalent there. In the latter case it is said to be endemic.

Whatever be the cause of this epidemic folly, it would be unjust to ascribe it to the freedom of the press.
Warburton, *Divine Legation*, Ded. to Freethinkers (1738).

A dread of mad dogs is the epidemic terror which now prevails.
Goldsmith, *Citizen of the World*, lxi.

The hint becomes the more significant from the marked similarity of the cholera-track of the present year to that which has on former occasions been followed, after a twelvemonth's interval, by a regular invasion of epidemic cholera.
Saturday Rev., Oct. 21, 1865.

II. *n.* 1. A temporary prevalence of a disease throughout a community: as, an epidemic of smallpox.

The earlier epidemics of malignant cholera which visited Europe were believed to have been heralded by an unusual prevalence of "fevers" and diarrheal affections.
Quain, *Med. Dict.*, p. 441.

2. The disease thus prevalent.

Those dreadful exterminating epidemics, which, in consequence of scanty and unwholesome food, in former times not unfrequently wasted whole nations.

In deliberative oratory the immediate object is to persuade the assembly to adopt or to deter it from adopting the measure under discussion; in judicial oratory it is accusation or defense of the person under trial; but in epideictic oratory it is simply the treatment of a subject before an audience for the purpose of affording pleasure or satisfaction.

epigenesis (ep-i-jen'e-sis), *n.* [*< Gr. ἐπί, upon, in addition, + γένεσις, generation: see genesis.*] 1. The coming into being in the act or process of generation or reproduction; the theory or doctrine of generation in which the germ is held to be actually precreated by the parents, not simply expanded or unfolded or made to grow out of an ovum or spermatozoon in which it preexisted or had been preformed. Thus, in its application to plants, this theory maintains that the embryo does not preexist in either the ovary or the pollen, but is generated by the union of the fecundating principles of the male and female organs. In zoölogy the doctrine supplanted the theory of incasement (see *incasement*), as held by both the animalculists and the oviulists, and may be considered to have itself "incased" the germ of all modern doctrines of ontogenetic biogeny, or evolution of the individual from preexisting individuals. The theory was promulgated in substance in 1759 by C. F. Wolff, and in a modified form, as above, is the doctrine now accepted.

More correctly, perhaps, *epigenesis* is an event of evolution, and evolution impossible without *epigenesis*; for evolution, strictly speaking, is the unfolding of that which lies as a preformation in germ, which a new product with new properties manifestly does not, any more than the differential calculus lies in a primeval atom; while *epigenesis* signifies a state that is the basis of, and the causative impulse to, a new and more complex state.

In man the epiglottis is of oblong figure, broad and round above, attached by its narrow base to the anterior angle of the upper border of the thyroid cartilage or Adam's apple, and also to the hyoid or tongue-bone, and the tongue itself; its ligaments for these attachments are the thyro-epiglottic, hyo-epiglottic, and glosso-epiglottic, the latter three in number, forming folds of mucous membrane. The muscles of the epiglottis are three, the thyro-epiglottideus and the superior and inferior aryteno-epiglottideus. Its substance is elastic yellow fibrocartilage, covered with mucous membrane continuous with that of the fauces and air-passages. In its ordinary state, as during respiration, the epiglottis stands upon end, uncovering the opening of the larynx; during the act of deglutition it is brought backward so as to protect this orifice. one of the episcopal vestments, consisting of a piece of brocade or some other stiff material shaped like a rhomb or lozenge, and worn on the right side at or below the knee, hanging by one of its angles from the zone or girdle. The other three angles have tassels attached to them, and it is embroidered with a cross or other ornamentation. As late as the eighth century, and in some places as late as the eleventh, a handkerchief or napkin (the *encheirion*, which see) was worn in a similar manner, as it still is in the Armenian Church, and the epigonation is probably a more modern form of this. Accordingly, some writers connect this vestment with the towel (ἄντηρ) with which Christ girded himself before washing the disciples' feet. John xiii. 5.

Attached to the . . . [zone], on the right side, the Bishop wears an ornament . . . termed the *epigonation*; it is . . . made of brocade, or some other stiff material, a tassel being attached to the lower corners. This was at first, like the Latin mantle, a mere handkerchief.

Sw. *epigram*, < L. *epigramma*, < Gr. ἐπίγραμμα(-), an inscription, an epigram, an epitaph, < ἐπιγράφειν, inscribe: see *epigraph*.] 1. In Gr. lit., a poetical inscription placed upon a tomb or public monument, as upon the face of a temple or public arch. The term was afterward extended to any little piece of verse expressing with precision a delicate or ingenious thought, as the pieces in the Greek Anthology. In Roman classical poetry the term was somewhat indiscriminately used to designate a short piece in verse; but the works of Catullus, and especially the epigrams of Martial, contain a great number with the modern epigrammatic character.

This *Epigramme* is but an inscription or writing made as it were upon a tablet, or in a window, or upon the wall or mantel of a chimney in some place of common resort.

Puttenham, Arte of Eng. Poesie, p. 43.

Probably the first application of the newly adapted art [engraving words on stone or metal] was in dedicatory inscriptions or *epigrams*, to use this word in its original sense.

C. T. Newton, Art and Archaeol., p. 100.

Hence—2. In a restricted sense, a short poem or piece in verse, which has only one subject, and finishes by a witty or ingenious turn of thought; hence, in a general sense, an interesting thought represented happily in a few words, whether verse or prose; a pointed or antithetical saying.

The qualities rare in a bee that we meet

In an epigram never should fall;

The body should always be little and sweet,

And a sting should be left in its tail.

Trans. from Latin (author unknown).

From the time of Martial, indeed, the *epigram* came to be characterized generally by that peculiar point or sting which is now looked for in a French or English *epigram*; and the want of this in the old Greek compositions doubtless led some minds to think them tame and tasteless. The true or the best form of the early Greek epigram does not aim at wit or seek to produce surprise. *Lord Seaver*.

Epigraphy is a science ancillary to philology, archaeology, and history. It is principally and properly devoted to the consideration of inscriptions in the strict sense—that is, texts cut, engraved, or impressed upon stone, bronze, or other material more or less rigid and durable, or one capable of becoming so, such as clay. *Graffiti*, or texts consisting of characters incidentally scratched on a wall, etc., and *dipinti*, in which the characters are painted, not carved, are for convenience sake also classed as inscriptions. On the other hand, the study of the lettering (legends, etc.) on coins belongs to numismatics.

In *rhet.*, the conclusion or closing part of a discourse or oration; the peroration. The office of the epilogue is not merely to avoid an abrupt close and provide a formal termination, but to confirm and increase the effect of what has been said, and leave the hearer as favorably disposed as possible to the speaker's cause and unfavorably to that of his opponents. Accordingly, an epilogue in its more complete form consists of two divisions—(a) a repetition of the principal points previously treated, and (b) an appeal to the feelings.

or tenuirostral birds, typified by the genus *Epimachus*; the plume-birds. They resemble the true birds of Paradise, or *Paradisaeae*, in the exceeding luxuriance and brilliancy of their plumage. (a) In most arrangements the *Epimachinae* have been referred to the family of *Proceropidae*, *Upupidae*, or closely associated with the *Proceropidae*. G. H. Gray (1869) constitutes the group by the genera *Ptilorhina*, *Craspedophora*, *Epimachus*, *Scuticoides*, *Semioptera*, and *Palcidia*, some of which genera are now referred to the *Paradisaeae*. The group thus constituted should be abolished. (b) In later arrangements the *Epimachinae* are made one of two subfamilies of *Paradisaeae*, containing the slender-billed forms represented by four genera, *Epimachus*, *Drepanornis*, *Scuticoides*, and *Ptilorhina*.

C. Elton, Origins of Eng. Hist., p. 90.

2. Among the ancient Greeks, a festival held in commemoration of the appearance of a god in any particular place.—3. [*cap.*] A Christian festival, closing the series of Christmas observances, celebrated on the 6th of January, the twelfth day after Christmas (hence called Twelfth-day), in commemoration of the manifestations of Christ to the world as the Son of God, in the West especially that to the Gentiles through the visit of the Magi in his infancy. It was early instituted in the East in celebration both of his nativity and of his baptism, the former being afterward transferred to the 25th of December. In the West it has been observed since the fourth century with special reference to the visit of the Magi or the three kings, with which are combined in the Roman Catholic Church his baptism and his first miracle at Cana of Galilee.

Therefore, though the church do now call Twelfth-day Epiphany, because upon that day Christ was manifested to the Gentiles in those wise men who came then to worship him, yet the ancient church called this day [the day of Christ's birth] the Epiphany, because this day Christ was manifested to the world, by being born this day.

An *epiphysis* is properly distinguished from an *apophysis*, or mere bony process or outgrowth without independent ossific center, being always autogenous or endogenous, and not merely exogenous; but the distinction is not always observed, especially as a completed and coossified epiphysis cannot be recognized as such with certainty. Thus, the bones of the proximal segments are the ossa propodialia; the radius and ulna, the tibia and fibula, constitute the epipodialia; the bones of the carpus and tarsus are mesopodialia; the metacarpalia and metatarsalia are . . . the metapodialia.

episcopacy (ē-pis'kō-pā-si), *n.* [As *episcopate* + *-acy*.] 1. Government of the church by bishops; that form of church government in which there are three distinct orders of ministers—bishops, priests or presbyters, and deacons. In episcopacy the order of bishops is superior to the other clergy, and has exclusive power to confer orders. Episcopacy is the organic system since early times of all the Oriental churches (Greek, Armenian, Coptic, etc.) and of the Roman Catholic Church, and also of the Anglican Church and its various branches. These churches teach that it is apostolic origin and essential to the maintenance of valid orders. Government by bishops was continued in the Scandinavian churches (called *Lutheran*) in Denmark and Sweden, in the latter country apparently without interruption at the Reformation. The Moravian Church also claims an uninterrupted succession. The bishops of the Moravian and American Methodist Episcopal churches are itinerant, and have no special diocesan jurisdiction. The Mormons also have an officer called bishop. Maintainers of episcopacy hold that (whether the word *bishop*, *ἐπίσκοπος*, *episcopos*, was for a time equivalent to *presbyter* or not) there was in apostolic times an order of presbyters superior in authority to ordinary presbyters, consisting of the twelve apostles, other apostles, and their colleagues, who transmitted so much of their authority as was to be used in continuing and governing the ministry to successors, called *bishops* after the first century, constituting an order which has continued till the present day. 2. The state of being a bishop; episcopal rank or office.

Under Cannte and his successors the practice of investiture with the ring and staff, or crozier, seems to have

been begun. Those emblems of *episcopacy* were sent by the chapter to the King, when a vacancy occurred, and were returned by him with a notification of the person whom he appointed.

E. *bishop*, q. v.] **I. a. 1.** Belonging to or vested in bishops or prelates; characteristic of or pertaining to a bishop or bishops; characterized by episcopacy: as, *episcopal jurisdiction*; *episcopal authority*; the *episcopal costume*; the *Episcopal Church*.

2. [cap.] Of or pertaining to the Episcopal Church, especially some branch of the Anglican Church specifically so called; relating to or connected with Episcopalianism: as, *Episcopal principles or practices*; an *Episcopal clergyman* or *diocese*; the Protestant *Episcopal liturgy*.—**Episcopal bench.** See *bench*.—**Episcopal chaplain.** See *chaplain*.—**Episcopal ring.** Same as *bishop's ring* (which see, under *bishop*).—**Episcopal staff.** See *staff*.—**The Episcopal Church,** the name popularly given to the Anglican Church in England, the United States, and elsewhere. (See *Anglican Church* (b), under *Anglican*, and *Church of England*, under *church*.) In the Protestant Episcopal Church in the United States each diocese has its own bishop, and a diocesan convention consisting of clerical members and lay members representing the parishes. This convention elects the bishop and legislates for the diocese. A General Convention, consisting of a House of Bishops and a House of Clerical and Lay Deputies from the dioceses, meets triennially, and is the supreme ecclesiastical legislature. The senior bishop, with the title of Presiding Bishop, has the presidency among the bishops, and represents the church to foreign churches. Each parish and congregation is governed in spiritual matters by the rector or priest in charge, while temporal affairs are intrusted to the churchwardens and the vestry elected by the people. The rector is elected by the vestry and appointed by the bishop. The Apostles' and the Nicene Creed and the Thirty-nine Articles are the standards of doctrine in both the English and American branches of the church; but the American church omits the Athanasian Creed, which the English church retains, and has made some alterations in the Thirty-nine Articles, omitting Article xxi. The church acknowledges two sacraments, baptism and the Lord's Supper, as generally necessary to salvation (see *sacrament*), practices infant baptism, admits none to communion till confirmed or ready and desirous to be confirmed, suffers those only to officiate as ministers who have received episcopal orders, and does not agree doctrinally with either Arminians or Calvinists. There are three vaguely defined parties in the Episcopal Church. Those who especially emphasize the apostolic origin and authority of the church in contradistinction to non-Episcopal denominations are popularly called *High-churchmen*, and those who attach less importance to this distinction are known as *Low-churchmen*. (See *High-churchman*, *Low-churchman*.) Those who urge the largest liberty of faith and practice within the church communion are called *Broad-churchmen*. Those of rationalizing tendencies generally affiliate themselves with this party; hence the name *Broad Church* is often used to signify a rationalistic element in the Episcopal Church and even in non-Episcopal denominations.

In *zool.*, a continuous external layer investing and surrounding the theca of certain corals. It is the external indication of tabulae, and is well seen in the *Tubipora*, or organ-pipe corals. It is a secondary calcareous investment, probably a tegumentary secretion, very commonly developed both in simple and in compound corals. In the former it is placed outside the proper wall, to which it may be closely applied, or separated by the coeae. It may be very thin or quite dense, and in the latter case it is developed at the expense of the proper wall, which is then often indistinguishable. In compound corals it is not unusual to find a well-formed epitheca inclosing the whole corallum below, while each individual corallite has its own wall. See *tabula*.

epithelium (ep-i-thē'li-um), *n.* [NL., orig. used to designate the outer layer of the integument of the lips, which covers the papillae; *< Gr. ἐπι, upon, + θηλή, the nipple, teat, < θάειν, suckle.*] 1. In *anat.*, the superficial layer of cells of mucous membranes, covering the connective-tissue layer, corresponding to the epidermis of the outer skin and continuous with it at the mouth and other natural openings. The usual meaning of the word, however, is somewhat wider than this, and includes all tissues similar in structure to the above. It embraces the proper tissue of secreting glands, whether derived from the hypoblast, as in the case of the gastric and intestinal glands, the liver and the pancreas, or from the epiblast, as in the case of the sudoriferous, sebaceous, and mammary glands, or from the mesoblast, as in the case of the kidneys, ovaries, and testes; it is applied, moreover, to the peridyma of the cerebrospinal ventricular cavities and to the epidermis itself. With what seems a distinct widening of its meaning, the

term is not infrequently employed to designate the endothelium of blood- and lymph channels and of serous membranes. The epithelium is thus the covering of all free surfaces, mucous, external, and even serous, and forms the glands and other organs derived from these coverings. Epithelial tissue consists of cells, usually compactly set; the nuclei are usually distinct, with an intranuclear network and nucleoli. The intercellular substance is scanty, often inappreciable, and is called *cement*. It contains no blood-vessels or lymphatics, but nerve fibrils extend into it. The epithelial tissue, forming the outermost covering of free surfaces, is favorably situated for performing protective and secreting functions. The protective function is not only exhibited by the general layer of easily replaced cells coating the mucous membrane and outer skin, but in the latter case by a peculiar tendency to form keratin, and this results in a quite impervious outer horny layer, which guards against minor violence, the absorption of deleterious substances, and the invasion of pathogenic bacteria, as well as in the development of such special means of protection as scales and feathers, hair and nails. This chemical feature of that epithelium which is especially devoted to protection, the production of keratin, can be matched by no single peculiarity on the part of the secretory epithelium; for that must respond equally whether it is called upon to eliminate waste products, or to elaborate digestive ferments, or to manufacture milk. It is probable that some of the cells lining the digestive tract have an active absorptive function with reference to the products of digestion, and that they select and take up certain substances from the intestine, and after more or less elaboration pass them on to the blood- or lymph-channels. This forms a kind of inverted secretion. The epithelial cells of secreting glands are, in part at least, under the direct control of the nervous system. Whether epithelial cells having a purely protective function are, as regards their nutrition, under similar control is still a question. See *cuts* under *Malpighian* and *villus*.

The *epithelium* is the epidermis of the mucous membrane. *Wilson, Anat. (1847)*, p. 540.

2. In *ornith.*, specifically, the dense, tough cuticular lining of the gizzard. It is sometimes even bony, and sometimes deciduous.—3. In *bot.*, a delicate layer of cells lining the internal cavities of certain organs, as the young ovary, etc.: also applied to the thin epidermis of petals.—**Ciliated epithelium**, any variety of true epithelium the cells of which are individually furnished on their free surface with cilia. The cells are usually of columnar form, packed closely side by side, with the cilia on their exposed ends. These cilia are microscopic processes of the cell, like eyelashes from an eyelid, and keep up a continual lashing or vibratile motion, by which mucus is swept along the passages. Ciliated epithelium is found in man in the whole respiratory tract, the middle ear and Eustachian tube, the fallopian tubes and part of the uterus, in portions of the seminal passages, and in the cavities of the brain and spinal cord.—**Columnar or cylindrical epithelium**, epithelium whose cells are more or less rod-like in shape, set on end, and joined together by their sides into a membrane. These cells are usually flattened or somewhat prismatic by mutual pressure. Goblet-cells are a modification of ordinary columnar epithelium cells, scattered here and there among the latter.—**Germinal epithelium**. See the *extract*.

The epithelial investment of the abdominal cavity retains its primitive character along a tract which corresponds to the rudiment of the primitive kidney longer than it does in other regions; and this epithelial layer may be distinguished as the *germinal epithelium*. *Gegenbaur, Comp. Anat. (trans.)*, p. 608.

Pavement epithelium, epithelium in which the cells are flattened and coherent by their irregular polygonal edges, like the tiles of a mosaic pavement. Also called *tessellated*, *squamous*, *lamellose*, *lamellar*, and *flattened epithelium*. It may be either *simple*, when it consists of a single layer of cells, as in the epithelium of the pulmonary alveoli, or *stratified*, when it consists of several layers, as in the epidermis.—**Simple epithelium**, any epithelium whose cells form a single layer: distinguished from *stratified epithelium*.—**Spheroidal epithelium**, glandular epithelium, characteristic of the terminal recesses and crypts of the secreting surfaces of glands, with more or less spheroidal or polyhedral cells.—**Stratified epithelium**, any epithelium whose cells are in two or more layers or strata, one upon another.—**Tegumentary epithelium**, the epidermis.—**Tessellated epithelium**. Same as *pavement epithelium*.—**Transitional epithelium**, stratified epithelium of three distinguishable layers of cells, such as occurs in the ureters and urinary bladder.—**Vascular epithelium**, the epithelial or endothelial lining of blood-vessels and lymphatics.

epoch (ē'pōk or ep'ok), *n.* [= F. *époque* = Sp. *época* = D. *epoche* (< F.) = G. *epoche* = Dan. *epoke* = Sw. *epok*, < ML. *epocha*, < Gr. *ἐποχή*, a check, cessation, stop, pause, epoch of a star, i. e., the point at which it seems to halt after reaching the highest, and generally the place of a star; hence, a historical epoch; < *ἐπέχειν*, hold in, check, < *ἐπι*, upon, + *έχειν*, have, hold, = Skt. *√ sah*, bear, undergo, endure.] 1. A point of time from which succeeding years are numbered; especially, a point of time distinguished by some remarkable event, or the event itself as distinguishing the time of its occurrence.

3. In *geol.*, specifically, one of the shorter divisions of geological time. This word is used differently by different geological writers. Thus, Jukes divides the entire series of fossiliferous strata into only three epochs, while Dana makes eight out of the Lower Silurian alone. "An *era* is a succession of time; an *epoch* is a point of time. An *era* commonly begins at an *epoch*. We live in the Christian *era*. In the Protestant *era*, in the *era* of liberty and letters. The date of the birth of Christ was an *epoch*; the period of the dawn of the Reformation was an *epoch*" (A. Phelps, Eng. Style, p. 365). *Period* may be the opposite of *epoch*, in being the date at which anything ends, or it may be more duration, or duration from point to point; the word is very free and often indefinite in its range of meaning. The meaning of *age* is modified by its connection with human life, so as often to be associated with a person; as, the *age* of Pericles; but it is also freely applied to time, viewed as a *period* of some length; as, the *bronze age*; the *golden age*; this is an *age* of investigation.

"The Methods of Ethics" was published in 1874, but whether or not most of the joint-work of Profs. Fowler and Wilson was written before that time, it is at least fair to say that the position of Prof. Sidgwick is not dealt with in the way which is demanded by the *epoch-making* character of his book. *Mind*, XII, 596, note.

epode (ep'ōd), *n.* [< OF. *epode*, F. *épode* = Sp. *épodo*, < L. *epodos*, < Gr. *ἐπώδος*, an epode, an after-song, adj., singing to or over, < *ἐπι*, upon, to, besides, + *αἰδένειν*, *αἰδένω*, sing, > *ώδω*, a song, ode: see *ode*.] 1. Thus, two collections of objects are equal in number when the operation of counting, applied to the two, ends with the same number; two lengths are equal when either will cover the other; two stars appear of equal brightness when the eye can detect no difference between them in this respect. Quantities of two or more dimensions are equal only when they are equal in each dimension separately. Thus, two vectors are not necessarily equal because they are equal in length; it is necessary that they should also be parallel. It is therefore preferable not to speak of two forces (or anything else capable of representation by vectors) as equal, unless they are parallel. Nevertheless, the prevalent mathematical usage is, or has been until recently, to call two such things equal when their tensors or moduli are equal. On the other hand, common usage presents an opposite inconsistency in refusing to call geometrical figures (particularly triangles) equal unless they can be superposed. Euclid and some modern geometers make it an axiom that figures which can be superposed are equal; but others define equal figures as such as can be superposed.

sign = between them; or an expression of the
same quantity in two terms dissimilar but of
equal value: as, 3 lb. = 48 oz.; $x = b + m - r$.
In the latter case x is equal to b added to m with r sub-
tracted from the sum, and the quantities on the right hand
of the sign of equation are said to be the value of x on the
left hand. An equation is termed simple, quadratic, cubic,
or biquadratic, or of the 1st, 2d, 3d, or 4th degree, ac-
cording as the index of the highest power of the unknown
quantity is one, two, three, or four; and generally an

according as the highest power of the unknown quantity
is of any of these dimensions.

other form the left-hand member of the equation, and are
connected by the sign of equality with the symbols of the
products of the reaction. It is called an equation because
the weight of the substances reacting must exactly equal
the weight of the products of reaction.—*Abelian equa-

the equation $d^2y/dx^2 + x^{-1}dy/dx + (1-x^2)y = 0$, the
solution of which involves the Besselian function.—*Bi-
nomial equation*. See *binomial*.—*Biquadratic equa-
tion*. Such equations were first solved by the Italian
mathematician Ludovico Ferrari (1522-65). His method

is as follows: Let the biquadratic be $x^4 + ax^3 + bx^2 + cx + d = 0$. Find a root of the cubic $y^3 - by^2 + (ac - 4d)y - d(a^2 - 4b) - c^2 = 0$. Then the roots of the biquadratic are the same as those of the two quadratics

$$\pm \sqrt{a^2 - 4b + 4y} [x^2 - 4b + 4y + ay - 2c] = 0.$$

Thus, if we have the equation $ux + 1 + Px = 0$, where $P = 1$ when x is divisible by 3, $P = x$ when $x - 1$ is divisible by 3, and $P = 2x$ when $x + 1$ is divisible by 3, the equation given is a circulating equation. — **Clairaut's equation**, the equation $y = x \frac{dy}{dx} + F(\frac{dy}{dx})$. — **Complete equation**. See *incomplete equation*. — **Compound equation**. Same as *adjoined equation*. — **Connected equations**, a system of equations such that one of them can be deduced from the rest. — **Constitutive equation**, the equation which expresses the conditions of a problem. — **Construction of equations**. See *construction*. — **Conversion of equations**. See *conversion*. — **Cubic equation**, an equation of the third degree. The algebraic solution of the general cubic equation was discovered by Scipione dal Ferro (died 1525?). His method, commonly known as that of Cardan, and perfected by Hudde, is as follows: Let the cubic equation be $x^3 + 3ax^2 + 6bx + 2c = 0$. Calculate three subsidiary quantities, p, q, R , by means of the equations $p = 2b - a^2, q = a^3 - 3ab + c, R^2 = p^3 + q^2$. Then, denoting by ρ any cube root of unity, and by the radical a real quantity,

$$x = \rho \sqrt[3]{-q + R} + \rho^2 \sqrt[3]{-q - R} - a,$$

which gives three values for the three values of ρ . If all the roots are real, this method is inconvenient; and we have the "irreducible case of Cardan's solution," when we may calculate two subsidiary quantities, r and θ , by the equations $r^3 = q^2 - R^2, \tan^2 \theta = -R^2/q^2$, and the three roots will be $x_1 = -2r \cos \theta - a, x_2 = -2r \cos(\theta + 120^\circ) - a, x_3 = -2r \cos(\theta - 120^\circ) - a$. — **Darboux's equation**, the equation $Adz + Bdy + C(ydz - xdy) = 0$, where A, B, C are rational functions of x and y . — **Depression of an equation**. See *depression*. — **Derived equation**, the equation which expresses the vanishing of the differential coefficient of a given equation. Thus, if $x^5 + x^3 = x^2 + 1$ is the given equation, the derived equation is $5x^4 + 3x^2 = 2x$. — **Determinate equation**, an equation containing only one unknown quantity, or only as many as there are equations in the system. — **Difference equation**, an equation expressing a relation between the value of a function (or the values of several functions) for all values of the variable or variables and the values when the several variables are increased by 1, 2, 3, etc. Thus, $f(x, y) = f(x + 1, y) + f(x, y - 3)$ is a difference equation. The order of a difference equation is equal to the difference between the highest and lowest values of the variable it involves. Thus, the equation just given is of the first order with respect to x and of the third order with respect to y . The degree of a difference equation is the degree of the equation in the unknown functions as variables. Thus, $f(x + 2) - [f(x + 1)]^2 + f(x) = 0$ is a difference equation of the second degree. But some mathematicians would make the degree of a difference equation strictly analogous to that of a differential equation. A linear difference equation with constant coefficients is solved by means of its characteristic equation (which see, above). — **Differential equation**, an equation expressing a relation between functions and their differential coefficients. An ordinary differential equation is one which contains only one independent variable; a partial differential equation is one which contains two or more independent variables. The order of a differential equation is that of the highest differential coefficient it contains. The degree of a differential equation is that of the power to which the highest differential coefficient is raised when the equation is in rational form and freed from fractions. A solution of a differential equation is an equation containing no differentials nor integrals unless of explicit functions and such that the given differential equation can be deduced from it. A general solution is one which is as indeterminate as possible—that is, which contains the number of arbitrary constants or functions indicated by the order of the equation. A particular solution is (a) with modern writers, a solution which is a particular case of the general solution; (b) with older writers, any solution not general. A singular solution is one which is neither general nor implied in the general solution. The complete integral of a partial differential equation is a solution containing the full number of arbitrary constants or functions. — **Disjunctive equation**. See *differential equation*. — **Particular equation**, an equation which takes account of initial positions and velocities or other peculiarities of a special problem. — **Personal equation**. (a) The constant which must be added to every time observed by one observer, in order to make the mean of such observations agree with those of another observer. If, for example, two observers note the times of passage of a series of stars over the same meridian, it will generally be found that one observer has a tendency to note the time later than the other, so that the mean difference, say for sets of twenty-five observations, presents some approach to constancy. In consequence of this, if we have to combine observations of the two observers, it will be proper to apply to all the observations of one of them a constant, in order to give the times such as they would have been observed by the other. This constant is the personal equation. The absolute personal equation is the amount which has to be added to the time as observed by any given observer in order to reduce the error of the mean of a large number of his observations to zero, or as nearly so as possible by any such constant correction. The personal equation is said to be eliminated when the observations are so treated that it does not affect the result. Thus, in determining the difference of longitude of two stations by the telegraphic transmission of the times of transit of stars over the two meridians, the result will be affected by the personal equation between the observers at the two stations. But if the observers afterward change places and redetermine the difference of longitude, the personal equation will enter into this second result with the opposite sign to that which it had before. Consequently, the mean of the two results will give a third result which is free from the effect of any constant personal equation. Hence, loosely—(b) Any kind of tendency to error of a determinate kind and amount peculiar to a given observer or reasoner for which it is possible to make any approximate allowance. — **Physical equation**, in *astron.*, the displacement of a planet from the position which an equable circular motion would give it owing to the eccentricity of the orbit being only one half that of the eccentricity. — **Primitive equation**, any equation from which another is derived in any way. — **Pure equation**, one in which each unknown occurs to only one degree. — **Quadratic equation**, an equation of the second degree. Such equations were solved by the ancients. Given $Ax^2 + 2Bx + C = 0$, the solution is

$$x = -\frac{B}{A} \pm \frac{B}{A} \sqrt{1 - \frac{AC}{B^2}}.$$

When B^2 is much larger than $\pm AC$, the two roots are nearly

$$-\frac{2B}{A} + \frac{C}{2B} \quad \text{and} \quad -\frac{C}{2B} + \frac{AC^2}{8B^3}.$$

See *epoch*. — **Solution of an equation**. See *differential equation*. — **Symbolic equation**. (a) A functional equation, or an equation whose members are not quantities. 1. In *astron.*, that imaginary great circle in the heavens the plane of which is perpendicular to the axis of the earth. It is everywhere 90° distant from the celestial poles, which coincide with the extremities of the earth's axis, supposed to be produced to meet the heavens, and its axis is this produced axis. It divides the celestial sphere into the northern and southern hemispheres. During his apparent yearly course the sun is twice in the equator, in the months of March and September. Then the day and night are everywhere equal, whence the name *equator*.

This same circle is cleped also the weyere, *equator*, of the day, for when the sunne is in the hevendes of Aries & Libra, than ben the daies & the nyghtes likle of lengthe in al the world.

2. In *geog.*, that great circle of the earth every point of which is 90° from the earth's poles, which are also its poles, its axis being also the axis of the earth. It is in the plane of the celestial equator. Our earth is divided by it into the northern and southern hemispheres. From this circle is reckoned the latitude of places both north and south.

Same as *equant*.—**Magnetic equator**, a line which nearly coincides with the geographical equator, and at every point of which the vertical component of the earth's magnetic attraction is zero—that is to say, a dipping-needle carried along it remains horizontal. See II.—**Equatorial dial**. See *dial*.—**Equatorial migration**. See *migration*.—**Equatorial telescope or instrument**. See II.

II. *n.* An astronomical instrument contrived for the purpose of directing a telescope upon any celestial object of which the right ascension and declination are known, and of keeping the object in view for any length of time notwithstanding the diurnal motion. For these purposes a principal axis resting on firm supports is placed parallel to the axis of the earth's rotation, and consequently pointing to the poles of the heavens. On this polar axis there is placed, usually near one of its extremities, a graduated circle, the plane of which is perpendicular to the polar axis, and therefore parallel to the equator. This circle is called the *equatorial circle*, and measures by its arcs the hour-angles, or differences of right ascension. The polar axis carries a second circle, called the *declination circle*, the plane of which is at right angles to that of the equatorial circle. This last circle has a telescope attached to it for making observations, which moves along with it in the same plane. The name *equatorial*, or *equatorial instrument*, is sometimes given to any astronomical instrument which has its principal axis of rotation parallel to the axis of the earth.

equilibrium (ē-kwi-lib'ri-ti), *n.* [*< L. æquilibrata(t)-s, < æquilibris, evenly balanced: see equilibrium.*] The state of being equally balanced; equal balance on both sides; equilibrium; equipoise: as, the theory of *equilibrium*.

equilibrium (ē-kwi-lib'ri-um), *n.* [Formerly also *æquilibrum*; = *F. équilibre = Sp. ccilibrio = Pg. It. equilibrio, < L. æquilibrum*, an even balance, a horizontal position, *< æquilibris, level, horizontal, evenly balanced, < æquus, equal, + libra, a balance: see libra.*] **1.** Equipoise; the state of being equally balanced; a situation of a body in which the forces acting on it balance one another; also, a determination of forces such that they balance one another, so that their resultant vanishes. Thus, when a heavy body rests on a table, the weight and the elastic forces which the weight evokes are in *equilibrium* (a phrase often used in the Latin form in *æquilibrum*, or more commonly in *equilibrio*)—that is, are precisely equal and opposite; thus, a man walking a tight-rope usually carries a pole or balancing-rod to aid him in preserving his *equilibrium*—that is, in keeping his center of gravity over the rope, so that his weight and the spring of the rope may act in the same vertical line. Similarly, a floating body is in *equilibrium* when its weight and the upward pressure or buoyancy of the liquid are exactly equal and opposite. When a body, being slightly moved out of its position, always tends to return to its position, the latter is said to be one of *stable equilibrium*; when a body, on the contrary, once removed, however slightly, from the position of equilibrium, tends to depart from it more and more, like a needle balanced on its point, its position is said to be one of *unstable equilibrium*; and when a body, being moved more or less from its position of equilibrium, will rest in any of the positions in which it is placed, and is indifferent to any particular position, its equilibrium is said to be *neutral or indifferent*. A perfect sphere, of uniform material, resting upon a horizontal plane, is in a state of *neutral equilibrium*; an oblate spheroid with its axis of rotation vertical is in *stable equilibrium*; while a prolate spheroid with its axis vertical is in *unstable equilibrium* on the same plane. A body suspended by its center of gravity is in a state of *neutral or indifferent equilibrium*. If a body is suspended by any other point, it will be in a state of *stable equilibrium* when its center of gravity is perpendicularly below the point of suspension; but if the center of gravity is above the point of suspension, the equilibrium will be *unstable*.

If any forces, acting on a solid or fluid body, produce *equilibrium*, we may suppose any portions of the body to become fixed . . . without destroying the *equilibrium*. *Thomson and Tait, Nat. Phil.*, § 564.

When at rest under the action of two equal and opposite forces, a point is said to be in *equilibrium*. *R. S. Ball, Exper. Mechanics*, p. 6.

2. The state of balance of any causes, powers, or motives, so that no effect is produced.

Center of equilibrium. See *center*.—**Relative equilibrium**, the instantaneous equilibrium of a particle; a situation from which a particle does not tend to move so long as other particles are held in their actual positions. Thus, a drop of water on the crest of a wave is in *relative equilibrium*.—**Thermal equilibrium**, such a distribution of heat within a gas subject to external forces (say the atmosphere) that no slow currents of its parts will alter the distribution of the heat in space. Thus, if the increase of pressure due to bringing a portion of air from any height to the earth would increase its temperature just enough to bring that air to the temperature of the surrounding air, the atmosphere would be in *thermal equilibrium*.

equilibrium-scale (ē-kwi-lib'ri-um-skāl), *n.* A scale or balance for weighing so arranged that if disturbed by any increase or diminution of the weight on the platform it will immediately return to a state of equilibrium or constant balance. II. n. In *arith.* and *geom.*, one of two or more numbers or quantities produced by multiplying other numbers or quantities by the same number or quantity; one of two or more numbers or quantities divisible by the same number or quantity: as, *mA, mB* are *equimultiples* of *A* and *B*. *Equimultiples* are always in the same ratio to each other as the numbers or quantities multiplied. If 6 and 9 are each multiplied by 4, the equimultiples 24 and 36 will be to each other as 6 to 9.

equinia (ē-kwin'i-ā), *n.* [*NL., < L. æquinus, of a horse: see equine.*] A dangerous infectious disease, communicated usually by contagion, occurring principally in horses, asses, and mules, but also occasionally in other domestic animals except cattle, and in man. The salient features of the disease are the formation of small tubercles, breaking down into ulcers, and the diffuse infiltration of large and irregular patches with a serous fluid containing numerous round cells. In addition, abscesses of considerable size are formed, and the lymphatics become inflamed and swollen. These processes go on for the most part in the cutaneous and subcutaneous tissues, and in the mucous and submucous tissues of the lungs and air-passages, especially the nose. If the cutaneous symptoms are in abeyance while the mucous membrane of the nose is severely affected and the discharge profuse, the disease is called *glanders*; if the cutaneous symptoms are well developed while the discharge from the nose is insensible, it is called *farcy*. Each of these forms may be either acute or chronic. *Equinia* in man is in a majority of cases fatal. It seems to be caused by a bacillus of about the size of the tubercle-bacillus.

The one is the first point of Aries, and is called the *vernal point* or *equinox*; the other is the first point of Libra, and is called the *autumnal point* or *equinox*. (See *equinox*.) These points are found to be moving backward or westward at the rate of 50" of a degree in a year, a movement constituting the precession of the equinoxes. See *precession*.—**Equinoctial time**, time reckoned from the instant at which the sun passes the vernal equinox: a method of reckoning time independent of the longitude, invented by Sir John Herschel.

The moment when the sun crosses the plane of the earth's equator, making the day and night everywhere of equal length (whence the name). There are two annual equinoxes, the *vernal*, which falls in the spring, namely, on the 21st of March according to the Gregorian calendar, and the *autumnal*, which falls in the autumn, namely, on the 22d of September. The term *equinox* is also loosely applied to the *equinoctial points* (which see, under *equinoctial*).

tial line be joined by a conductor, no flow through the conductor will take place.—**Equipotential surface**, a surface throughout which the potential (see *potential*) is everywhere the same; one which is everywhere perpendicular to the lines of force which it meets. If a particle were subject to the attractions and repulsions of a number of bodies that were held motionless, there would be a resultant force upon it in some certain direction. If, while held so that it could not acquire momentum, it were either allowed to move as urged by the resultant force or compelled to move directly counter thereto, it would describe a course, called a *line of force*, having an attracting body at one extremity and a repelling one at the other, or else passing off to infinity in one direction or the other. Through every point of space there would be such a line; and a surface so bending as to be everywhere perpendicular to these lines of force would be an *equipotential* or *level surface*. If such a surface were to be rendered impenetrable, the particle could lie upon it without tendency to move along it in any direction. Similarly, if any two points of an electrically equipotential surface are joined by a conductor, no flow will take place. The term *equipotential* is most generally used as applying to electrical or magnetic forces, but is also extended to gravitation, or forces having any origin whatever.

Equisetaceæ (ek'wi-sē-tā'sē-ē), *n. pl.* [NL., < *Equisetum* + *-aceæ*.] A very distinct natural order of vascular cryptogamous plants. Perennial, solid, running rootstocks are present in most cases, producing usually upright hollow stems with a grooved surface. In addition to the central canal of the latter, there is near the surface a circle of smaller canals (vallicular canals), opposite to the grooves (valliculæ) which mark the surface. Opposite the ridges is another set of still smaller cavities (carinal canals). The stomata are in the grooves, in some species forming a row on each side of the groove. The cuticle of the stem in many species contains a large amount of silica. The stem is jointed, and the central canal is intercepted by a partition (diaphragm) at each joint. Each joint bears at its upper end a circle of leaves which are united to form a sheath, while their tips project as teeth, which are deciduous in some species, in others persistent. Branches, when present, are formed in whorls at the joints of the stem, which they resemble, except in the absence of the central canal; and these may be again branched. The stems are either perennial and evergreen or annual. The fructification, borne either by the vegetative stems or by special fruiting stems, is a terminal conical structure whose central axis bears numerous angular, shield-shaped bodies (clypeolæ) attached by horizontal pedicels. Each clypeola bears from 6 to 9 sporangia, which open on their inner side and discharge their spores. The spores are spherical. The outer coat breaks into four slender, club-shaped filaments (elaters), which are attached to one side of the spore, and are coiled about it when moist, uncurling when dry. Their elasticity aids the discharge of the spores from the sporangia, and favors distribution. The germination of the spores results in irregularly lobed dioecious prothallia above ground. *Equisetum* is the only genus. See cut in preceding column.

Equisetites (ek'wi-sē-ti'tēz), *n.* [NL., < *Equisetum* + *-ites*.] A genus of fossil plants, belonging to the *Calamariæ*, an order represented at the present time by the *Equisetaceæ* (which see). This genus, although now of little importance, was once most widely distributed, and formed a very conspicuous portion of the flora of the earth, especially during the Carboniferous and Triassic periods. There is much difficulty in classifying the fossil *Equisetaceæ*, in consequence of the imperfect preservation of important portions of the specimens studied. By some authors the genus *Equisetites* is not admitted as having been clearly established. Some also retain the name *Equisetaceæ* (instead of *Calamariæ*) for the fossil order, as well as for the recent.

Equisetum (ek-wi-sē'tum), *n.* [NL., < *L. equisetum*, -sæta, -sætis, < *equus*, a horse, + *sæta*, a bristle.] A genus of plants, constituting alone the order *Equisetaceæ*. There are about 25 species known, of which 8 are found in Great Britain and 13 in North America, some being common to both countries. The cuticle abounds in silica, on which account the stems of some species are used for polishing wood and metal. *Equisetum hiemale*, the scouring-rush, is best suited for this purpose, and is largely imported into England from the Netherlands. The species of *Equisetum* are popularly called *horsetails*. See cut in preceding column.

of procedure practised by them: as, *equitable* rights or remedies; *equitable* rules or powers. See *equity*.

There is hardly a subject of litigation, between individuals, which may not involve those ingredients of fraud, accident, trust, or hardship, which would render the matter an object of *equitable*, rather than of legal, jurisdiction, as the distinction is known and established in several of the states. A. Hamilton, *Federalist*, No. 133.

Equitable assets. (a) Property not leviable under execution, and only to be reached by interposition of a court of equity. (b) Property belonging to the estate of a decedent by law not subject to payment of his debts in course of administration, but voluntarily charged by the testator with payment of debts generally, or upon which equity fastens a trust for that purpose.—**Equitable conversion**, a transformation of a fund from real to personal or from personal to real, assumed in equity to have been made in order to secure the application to the succession to or administration of that fund of the principles which the intention of a testator or the rights of parties interested require. Thus, where a will imperatively directs real property to be sold and distributed as money, the court may treat the fund as equitably converted from the testator's death, although the executors neglect to make an actual conversion into money.—**Equitable defense or plea**, a defense or plea which, though it would not be available at common law, is available under the rules of equity.—**Equitable disseizin, estate, estoppel, mortgage, owner, seisin, waste**, etc. See the nouns.—**Equitable title**. Equity in Law is the same that the Spirit is in Religion, what every one pleases to make it.

Selden, *Table-Talk*, p. 46.

(b) The system of jurisprudence or body of doctrines and rules as to what is equitable and fair and what is not, by which the defects of, and the incidental hardships resulting from, the inflexibility of the forms and the universality of the rules of the common-law tribunals are corrected or remedied, and substantial justice is done. In the early history of the English people it was found, as society advanced, that many grievances arose which were not included in the classes of cases which the common law authorized the judges to take cognizance of. Hence it became customary for those who could not obtain redress in the courts, because no common-law action appropriate to their grievance had been sanctioned, or because the common law, while equitable and fair in its general application, was unfair in its application to their particular case, to apply to the king in Parliament or in council for justice. Petitioners in such cases (if it could be shown that there was no adequate remedy at law, or that the operation of the common law was unfair in its application to the particular case in hand) were referred to the chancellor (originally an ecclesiastic), the keeper of the king's conscience, who, after hearing the parties, required what was equitable and just to be done, under penalty of imprisonment, excommunication, etc. Thus, the common-law remedy of collecting a debt by getting judgment and execution became established at a time when property consisted almost entirely of lands and goods; but as wealth increased, and appeared in the forms of intangible property, such as valuable rights in action, contracts, securities, patents, copyrights, etc., the chancellor would entertain a complaint (called a *bill in equity*) from a creditor, setting forth that he was unable to collect his judgment out of property that could be reached by legal process, and that the debtor had other property which ought to be applied in payment, and asking that the defendant be compelled to do what equity and good conscience required to be done. The chancellor (the Court of Chancery) could compel the debtor to assign his intangible property to a receiver, a mode of relief which the law had never conferred on a sheriff the power to afford. Or if a creditor, to secure his demand, obtained from his debtor a deed which in terms was an absolute conveyance, and was proceeding to enforce it as if it were so intended, the Court of Chancery would entertain a complaint from the debtor offering to pay the debt, and asking to be allowed to redeem the land. The steady growth of the complexities of property and of business and social relations increased the cases requiring equitable remedies to supply the deficiency of common-law remedies, or equitable interference with the unenforceable enforcement of common-law rules, until the procedure in equity developed a substantive system of doctrines and remedies covering a great variety of subjects scarcely contemplated by the common law. In England and the United States the doctrines of the common law have now generally been subjected to the established modifications introduced by equity, and in many jurisdictions the two systems of rules thus merged and modified are administered by the same courts. This new system is generally known in the United States as the *code practice*, or the *new or reformed procedure*.

There is not . . . a single department of the law which is more completely fenced in by principle, or that is better limited by considerations of public convenience, both in doctrine and discipline, than *equity*. Story, *Max. Writings*, p. 540.

(c) The court or jurisdiction in which these doctrines are applied: as, a suit in *equity*. (d) An equitable right; that to which one is justly entitled; specifically, a right recognized by courts of equity which the common law did not provide for: as, the wife's *equity*, or her right, when her husband sought to enforce his common-law claim to reduce her property to his own possession, to have a portion of it settled on herself. (e) The remaining interest belonging to one who has pledged or mortgaged his property, or the surplus of value which may remain after the property has been disposed of for the satisfaction of liens. [U. S.] (f) A right or obligation incident to a property or contract as

between two persons, but not incident to the property or contract from its own nature. —**Law of equivalents, in chem.**, the law that the several combining weights of any number of bodies which form compounds with a given other body are either the same or simple multiples of the combining weights of these several bodies when they form compounds with one another. Thus, if a body A unite with other bodies B, C, D, then the quantities B, C, D (the letters being used to denote the combining quantities as well as the bodies) which unite with it, or some simple multiples of these quantities, represent for the most part the proportions in which they unite among themselves. The various quantities A, B, C, D (or multiples of them) are termed the *equivalents* of one another. Thus, 1 part by weight of hydrogen unites with 8 parts by weight of oxygen to form water, with 35.5 of chlorine to form hydrochloric acid, with 16 of sulphur to form sulphureted hydrogen; these quantities or their multiples are therefore regarded as equivalents of one another, 8 parts of oxygen uniting with 35.5 of chlorine to form chlorine monoxide (Cl₂O), and 16 of sulphur with 8 × 2 of oxygen to form sulphurous oxide (SO₂). When the atomic weights are taken into account (H = 1, O = 16, S = 32, Cl = 35.5), it is seen that one atom of hydrogen is the combining equivalent of one of chlorine, and two atoms of hydrogen of one of oxygen and one of sulphur; and taking the quantitative value of hydrogen as unity, chlorine is *univalent*, oxygen and sulphur are *bivalent*. Upon this equivalency or quantitative value of the different elements is based their classification into *monads*, *dyads*, *triads*, *tetrads*, etc., and accents (sloping strokes) are frequently appended to the symbols in a formula to show to which class the bodies belong, as H₂O⁺, N⁺H₃, C⁺⁺H₄, or C⁺⁺H₄.—**Mechanical or dynamic equivalent of heat, in physics**, the amount of mechanical energy which is equivalent to (that is, which when transformed into heat will produce) one heat unit. This constant quantity has been determined in several ways. The first accurate experiments were by Joule, who measured the amount of heat produced by the friction of a paddle-wheel in a vessel of water, the energy required to turn the paddle being supplied by a known weight descending through a known distance. Joule found that to raise one pound of water 1° F. (heat unit), 772 foot-pounds of mechanical work were required, and to raise it through 1° C., 1,390 foot-pounds. This constant is often called *Joule's equivalent*. See *heat*.—**Morphological equivalents**, the similar forms which occur in different genetic series having a common origin, and probably due to similar causes.

-er¹. [C ME. *-ere* (in early ME., as in AS., the final *e* was sounded), < AS. *-ere* = OS. *-eri* = OFries. *-ere*, *-er* = D. *-er* = MLG. *-ere*, *-er*, LG. *-er* = OHG. *-äri*, *-äri*, *-eri*, MHG. *-ere*, *-er*, G. *-er* = Icel. *-ari* = Sw. *-are* = Dan. *-er* = Goth. *-arei-s*; a common Teut. formative, suffixed to verbs to form nouns of the agent, as in AS. *bæcere*, a baker, *ereopere*, a creeper (cripple), *del-fere*, a deliver, etc.; = L. *-arius* (whence directly E. *-aryl*, *-ari-an*, and ult. *-er*²) = Gr. *-ῆτιος* (in L. and Gr. forming adjectives (used also as nouns) from nouns or verbs); orig. a compound suffix, < **-ar* + *-ia*.] An English suffix, originally and properly attached to verbs to form nouns of the agent, as in *baker*, *creeper*, *deliver*, *driver*, *reader*, *sower*, *writer*, etc. Though denoting usually a person, it may denote also, or only, a thing, as *ruler*, *heater*, *grater*, *poker*, etc. In use it is equivalent to the Latin *-or* in such forms as *instructor*, one who instructs, *actor*, one who acts, *confessor*, one who confesses, etc. Accordingly, English verbs from Latin apply or perfect participle stems may form their noun of the agent with English *-er* or Latin *-or*: *instructor* or *instructor*, *confessor* or *confessor*, etc. Usually they prefer the Latin form, taking it directly (or mediately through Middle English *-our*, < Old French *-our*, < Latin *-or*, etc.) from the Latin, or forming it by analogy (as *depositor*, *radiator*, etc.), for which there is no Latin original). The suffix *-or* is thus a rough means of distinguishing words of Latin origin: compare *auditor*, *instructor*, *factor*, etc., with their literal English equivalents *hearer*, *teacher*, *doer*, etc. In many words, as *biographer*, *geographer*, *philosopher*, etc., there is no accompanying verb, the suffix, which is equally referable to *-er*², being attached, cumulatively (first in *philosopher*), to the original (Latin or Greek) term qualifying an agent. (See *-er*².) In another use, also without reference to a verb, *-er*, attached to names of towns or countries, signifies an inhabitant of or one who belongs to the town or country, as *Londoner*, *New Yorker*, *Hollander*, *Englander*, *New Englander*, etc., like German *Berliner*, *Leipziger*, *Engländer*, *Holländer*, etc.

-er². [C ME. *-er*, *-ere*, < OF. *-ier*, *-ier*, F. *-ier* = Sp. Pg. *-iero*, *-ero* = It. *-iere*, *-ero*, < L. *-arius* (whence directly E. *-aryl*, *-ari-an*, as in *antiquary*, *antiquarian*, *n. justiciary*, etc.) = *-er*¹: see *-er*¹.] A suffix of Latin origin, denoting usually a person, and often an agent, but not, like *-er*¹, usually associated with a verb. It appears in *justicer*, *commissioner*, *officer*, *prisoner*, *pensioner*, etc. In many words of more recent formation the suffix may be taken as either *-er*¹ or *-er*². In some words, as *chancellor*, it has assumed the form of Latin *-or*. In words recently formed or taken from the French it appears as *-ier* or *-eer*. In many words it has become merged or is mergeable with the English *-er*¹.

-er³. [C ME. *-er*, with suffix of declension *-ere*, often with syncope *-re*, < AS. *-er*, *-or* in adverbs, but in adjectives always with suffix of declension, masc. *-a*, fem. and neut. *-e*, and reg. with syncope *-r-a*, *-r-e*; = OS. *-ir-o* = D. *-er* = OHG. *-ir-o*, *-ro*, MHG. *-ere*, *-er*, G. *-er* = Icel. *-ri* = Sw. *-re* = Dan. *-re* = Goth. *-ä-ra*, *-ä-ra*, fem. *-iz-ei*, *-öz-ei*, neut. *-iz-ō*, *-öz-ō* = L. m. f. *-i-or*, neut. *-ius* (*-i-or*) = Gr. m. f. *-i-ov* (*-i-ov*), neut. *-i-ov* = Skt. *-iyas* (nom. m. *-iyān*, f. *-iyasī*, n. *-iyas*); a comparative suffix, of the orig. Indo-Eur. form **-ias*. It appears as *-es* in the superlative suffix *-est*¹, q. v.] A suffix of adjectives, forming the comparative degree, as in *colder*, *deeper*, *greater*, *bigger*, etc., and being cognate with the Latin comparative suffix *-or*, *-ior*, neuter *-us*, *-ius*, represented in English in *major*, *minor*, *minus*, *prior*, *superior*, *inferior*, etc. In *lesser*, *former*, the suffix is cumulative. In *better*, *worse*, *less* (for irregular suffix, see etymology), the suffix is attached to a now non-existing positive. In *upper*, *inner*, *outer*, *utter*, etc., the positive is adverbial. See the words mentioned.

-er⁴. [C ME. *-er-en*, < AS. *-er-ian* (not common) = D. *-er-en* = G. *-er-en*, *-er-n*, etc.] A suffix of verbs, giving them a frequentative and sometimes a diminutive sense, as *patter* from *pat*, *swagger* from *scag*, *flutter* from *float*, *sputter* from *spout*, etc. It is equivalent to and cognate with the frequentative *-e* (that is, *-e*), as in dialectal *pattle* = *patter*, *scuttle* from *scud*, etc. As a formative of new words it is scarcely used.

-er⁵. [C OF. *-er*, *-re*, term. of nouns from inf., < iuf. *-er*, *-re*, < L. *-äre*, *-ere*, *-ere*, inf. suffix of inf.,

2d, and 3d declensions respectively.] A suffix of certain nouns, mostly technical terms of the law (from Old Law French), as *attainder*, *misnomer*, *trover*, *user*, *non-user*, *waiver*, etc. In *endeavor*, *endeavour*, the orig. *-er* is disguised in the spelling.

C., January 1st, in use in Spain until the end of the fourteenth century. Also called *era of the Cæsars*.—**Vulgar era**, or **Christian era**, the era beginning with the birth of Christ; the ordinary count of years in Christian countries; the "years of our Lord," the "years of grace," etc. The abbreviation A. D. (Latin *anno Domini*, in the year of the Lord), or P. C. (Latin *post Christum*, after Christ), is prefixed to the number of years after the epoch, and B. C. (before Christ), or A. C. (Latin *ante Christum*, before Christ), is affixed to the years before the epoch. The year preceding A. D. 1 is 1 B. C.; but astronomers call the latter year 0, and the year preceding it 1. The vulgar era was invented in the sixth century by Dionysius Exiguus, and came into general use under the Carolingians. The years were originally and are now considered as beginning January 1st. Dionysius supposed that Jesus Christ was born December 25th, A. D. 1, a date which is now universally considered to be from three to six years too late. It was, however, until this century generally understood that the era was fixed upon the supposition that Christ was born December 25th, 1 A. C. It was for several centuries a common practice to begin the year on March 25th, the day of the Annunciation. The result was that in some places the year, which according to the original and now universal practice would begin on January 1st, was taken to begin on the previous March 25th, while in other places it was taken to begin on the subsequent March 25th. In England the latter method was used. The year was often taken to begin on December 25th. During a part of the seventeenth and eighteenth centuries both years were commonly given to dates between December 25th and the following March 25th: thus, January 9th, 1693. Also called *common era*, *era of Christ*, *era of the Incarnation*. = Syn. 2. *Period*, *Age*, etc. See *epoch*.

A morbid growth arising from a diseased condition of the ovary of various grasses, caused by a fungus of the genus *Claviceps*. The growth of the fungus begins by the formation of a filamentous mycelium upon the surface of the ovary, which it destroys and displaces, retaining approximately its shape. The surface of this tissue is marked by furrows. At this stage conidia are produced upon the tips of short hyphae; and in this form it was formerly considered a distinct species, under the generic name *Sphaecelia* (which has become a common name co-ordinate with *sclerotium*). When the formation of conidia is at its height, a thick belt of more compact hyphae is formed at the base of the mass. An isolated ascus from which the filiform spores are escaping. (Figs. 2, 3, and 4 somewhat reduced; 5, 6, and 7, highly magnified.)

The resulting structure is the *sclerotium* or *ergot*. It is a horn-like mass, often one inch in length. It lies dormant till fall or usually till the following spring, when branches arise in a tuft. Each becomes a stroma, consisting of a stalk and a small head. In the head are formed a number of flask-shaped perithecia, each containing many asci, of which each in turn incloses several filiform spores. The ergot of rye is caused by *Claviceps purpurea*. Ergot is said to cause a sort of gangrene in cattle, especially in the feet. It is used in medicine to cause contraction of the uterus and of the arterioles and as an abortifacient, and also in certain morbid states of the cerebrospinal axis, where its effect may or may not be due entirely to its action on the vessels. Also called *spurred rye*.

3. In *anat.*, the ealear, spur, or hippocampus minor of the brain. [Rare.]

According to this [the Brelon] Code, murder was not punishable by death, but only by fine levied on the relatives of the murderer, and called an *erick*. Hence bloodshed was frequent; and no Irishman's life was safe.

Brougham.

There is but one effective mode of displacing an error, and that is to replace it by a conception which, while readily adjusting itself to conceptions firmly held on other points, is seen to explain the facts more completely.

5. The difference between the observed or otherwise determined value of a physical quantity and the true value: also called the *true error*. By the error is often meant the error according to some possible theory. Thus, in physics, the rule is to make the sum of the squares of the errors a minimum—that is, that theory is adopted according to which the sum of the squares of the errors of the observations is represented to be less than according to any other theory. The error of an observation is separated into two parts, the *accidental error* and the *constant error*. The accidental error is that part of the total error which would entirely disappear from the mean of an indefinitely large series of observations taken under precisely the same circumstances; the constant error is that error which would still affect such a mean. The *law of error* is a law connecting the relative magnitudes of errors with their frequency. The law is that the logarithm of the frequency is proportional to the square of the error. This law holds only for the accidental part of the error, and only for certain kinds of observations, and to those only when certain observations affected by abnormal errors have been struck out. The *probable error* is a magnitude which one half the accidental errors would in the long run exceed; this is a well-established but unfortunate expression. The *mean error* is the quadratic mean of the errors of observations similar to given observations.

6. In law, a mistake in a judicial determination of a court, whether in deciding wrongly on the merits or ruling wrongly on an incidental point, to the prejudice of the rights of a party. 7†. Perplexity; anxiety; concern.

He . . . thought well in his courage that they were right high men and greater of estate than he cowde thinke, and a-boute his herte com so grete error that it wete all his visage with teeres of his yen.

ter vetch (cf. *ἐρβος*, the chick-pea, = Skt. *aravinda*, the name of a certain plant), = OHG. *araveiz*, *arwez*, MHG. *erweiz*, *arwez*, G. *erbse* = D. *erbet*, *erbet*, *erl*, the pea; hence the Scand. forms, Icel. *ertr*, pl. = Sw. *ärter* = Dan. *ært*, *ert*, pl. *ærter*, *erter*, peas.] A leguminous genus of plants not now maintained, its species being referred to *Vicia* and *Lens*.

ery (er'i), *a.* A dialectal contraction of *every*¹. **-ery**. [Early mod. E. also *-erie*; < ME. *-erie*, < OF. *-erie*, F. *-erie* = Sp. It. *-eria*, *-aria*, < L. *-eria*, *-aria*, fem. of *-erius*, *-arius*: see *-ary*, *-er*, *-er*.] Etymologically, *-ery* is *-er*² (ult. *-er*¹) with an abstract fem. ending.] A suffix originally of nouns from the French, but now used freely as an English formative. It is added to nouns, adjectives, and sometimes verbs, to form nouns in which the force of the suffix varies. Originally abstract, denoting the collective qualities of the subject (as in *fozery*, *fozery*, *hogery*, *hogery*, *witchery*, etc.), it has also or only a concrete sense, as in *finery*, *greenery*, etc. In a particular phase of this use it denotes a business, as in *fishery*, *grocery*, *pottery*, etc.; hence it came to refer to wares, etc., collectively, as in *grocery*, now usually in plural *groceries*, *pottery*, *crocery*, etc., and to the place where such wares are made or sold, or to any place of business, as in *grocery*, *pottery*, etc., *cannery*, *fishery*, *lawery*, *tripery*, etc., or to any place where the things represented by the subject are collected, as in *ferriery*, *pinery*, *rockery*, etc., especially to places where animals are collected, or to the animals collected, as in *henery*, *goosery*, *rookery*, *pinery*, *hogery*, etc. This termination easily associates with *-er* of whatever origin, especially with *-er*¹ or *-er*², denoting a person engaged in business. Compare *fisher* and *fishery*, *grocer* and *grocery*, *potter* and *pottery*, *crocker* and *crocery*, *lawyer* and *lawery*, etc. In many cases it appears syncretized as *-ry*, especially in the collective use, as in *citizenry*, *Englishry*, *poverty*, etc.

es¹. [*ME. es-, as-, < OF. es-, as-, < L. ex-: see ex-*] A prefix of Latin origin, being a French or other Romance modification of Latin *ex-*. Examples are seen in *escheat*, *eschaufe*, etc. Words having in Middle English *es-* have reverted to the original Latin *ex-*. See *exchange*, *exploit*, etc.

es². [*ME. es-, < F. es-, Sp. Pg. es-, < LL. i-s-: see def.*] An apparent prefix, of Romance origin, being radical initial *s* before another consonant, preceded by a slight euphonic vowel, as in *escalade*, *esquire*, *especial*, *estate*, *estray*, of ultimate Latin origin, and *escarp*, *eschew*, etc., of Teutonic origin, some of which have also forms (original or aphetic) without the *e*, as *scutcheon*, *squire*, *special*, *state*, *stray*, etc., while some with original (Old French or Middle English) *es-* have only *s-* in modern English, as *servicer*, *spiritual*, *strain*, etc. This Old French *es-* in most cases became later *e*, modern French *e-*: see *equerry*, *deu*. In *exchequer* this original *es-* has become *ex-*, suggesting falsely a Latin origin.

es¹. [*Mod. E. reg. written 's, < ME. -es, -is, < AS. -es: see -s¹.*] The early form of the possessive or genitive case singular, now regularly written *'s*, but still pronounced as *-es* (*-ez*) after a sibilant, namely, *s, z, sh, ch* (= *tsh*), *j*, written *-dge, -ge* (= *dzh*), *x* (= *ks*), as in *lass's*, *pace's*, *horse's*, *rose's*, *bush's*, *church's*, *hedge's*, *fox's*, etc. (formerly written *lasses*, *paces*, *horses*, *roses*, *bushes*, *churches*, *hedges*, *foxes*, etc.), words forced to conform in spelling to other words, like *boy's*, *man's*, etc. (formerly written *boys*, *maus*, etc.), where the *e* is actually suppressed in pronunciation; in Middle English and earlier the suffix was regularly *-es*, which still remains in possessives like *horses* (Anglo-Saxon and Middle English *horsas*), *guides* (Middle English *gides*), now written with the apostrophe, like other words, *horse's*, *guide's*. See *-s¹*.

-es³. [*ME. -es, -s: see -s³.*] The earlier form of *-s³*, the suffix of the third person singular of the present indicative of verbs, retained after a vowel, as in *huzzas*, *goes*, *does*, etc. When the infinitive ends in silent *e*, the personal suffix is regarded, orthographically, as simply *-s*, but it is historically *-es*, the infinitive *-e* being dropped before inflectional suffixes, as in *ruas*, *endues*, etc., *dejes*, *supplies*, *accompanies*, etc., infinitive *ruo*, *enduo*, *dejo*, *accompa*, etc., the termination *-y* being formerly *-ie*.

The act of escaping; escape.—2t. The general contrivance in a time-piece by which the pressure of the wheels (which move always in one direction) and the vibratory motion of the pendulum or balance-wheel are accommodated the one to the other. By this contrivance the wheelwork is made to communicate an impulse to the regulating power (which in a clock is the pendulum and in a watch the balance-wheel), so as to restore to it the small portion of force which it loses in every vibration, in consequence of friction and the resistance of the air. The leading requisite of a good escapement is that the impulse communicated to the pendulum be invariable, notwithstanding any irregularity or foulness in the train of wheels. Various kinds of escapements have been contrived: such as the *crown* or *verge*-*escapement*, used in common watches, and the *anchor* or *crutch*-*escapement*, in common clocks—both also termed *recoiling escapements*; the *dead-beat* *escapement* and the *gravity* or *remontoir*-*escapement*, used in the finer kind of clocks; the *horizontal* *escapement* or *cylinder*-*escapement*, the *detached* *escapement*, the *lever*-*escapement*, the *duplex* *escapement*, the *pinwheel* *escapement*, all used in the finer classes of watches; and the *half-dead* *escapement*, in which there is a slight recoil. It included the pikes, *Esocidae*, and a number of fishes of other families now known to be little related to the type.

Esocidae (e-sos'i-dē), *n. pl.* [*NL.*, *<Esoc* (*Esoc*) + *-idae*.] A family of haplous physostomous fishes, typified by the genus *Esoc*. They have a long slender body, with long head, flattened snout, and mouth armed with numerous strong sharp teeth, some of which are movable; upper jaw not protrusile, its border formed by the maxillary bone; dorsal fin far back, opposite the anal; scales small; and no pyloric caeca. The family is now restricted to the single genus *Esoc*, the pikes. (See cuts under *Esoc*, *pike*, and *scapuloceoracoid*.) In Bonaparte's and some other early systems it was equivalent to Cuvier's *Esocae*. Groups approximately or exactly corresponding to *Esocidae* have been named *Esoces* (Cuvier, 1817), *Esocinae* (Swainson, 1839), *Esocini* (Bonaparte, 1841), and *Esocidae* (Rafinesque, 1815). (*b*) The lip of the special esophageal groove of ruminants.—**Esophageal glands,** numerous small compound racemose crypts or follicles of the esophagus, as of man, lodged in the submucous tissue and opening by excretory ducts upon the mucous surface of the tube. In some cases, as of birds, they are highly specialized and yield a copious milky fluid used to feed the young, as those of the crop of pigeons. This secretion is called *pigeon's milk*. The remarkable proventricular glands of birds, of similar character, yield a digestive fluid like gastric juice.—**Esophageal groove.** See the extract, and *rumination*.

A groove (*esophageal groove*) which leads from the esophagus into the reticulum, and is shut off by a valvular process from the first two divisions of the stomach, represents that portion of the esophagus which has entered into the formation of the stomach and formed the first two portions of that organ by bulging out on one side.

It is a usual structure in annelids, arthropods, and many other invertebrate animals, but varies greatly in its details. See *cerebral*. Also known as *esophageal commissure, nerve-ring, nerve-pentagon* (in *echinoderms*), etc.—**Esophageal teeth,** certain enamelled processes of the backbone which project into the gullet of serpents of the subfamily *Dasyplatinae*. See *Rhachiodontidae*.

esophagotomy, œsophagotomy (ē-sō-faj'ē-gōt'ō-mi), *n.* [*< Gr. οἰσφαγός, esophagus, + τομή, a cutting.*] In *surg.*, the operation of making an incision into the esophagus, as for the purpose of removing any foreign substance that obstructs the passage.

esophagus, œsophagus (ē-sōf'ā-gus), *n.* [*< N.L. esophagus, < Gr. οἰσφαγός, the gullet, lit. the passage for food, < οἶσιν, fut. inf., associated with φέρειν = E. bear¹, carry, + φαγεῖν, eat.*] The gullet; the canal through which food and drink pass to the stomach. In man the esophagus is a musculomembranous tube about nine inches long, extending from the pharynx to the stomach. It begins in the neck, where the pharynx is reduced from a funnel to a tube, opposite the fifth intervertebral space, descends vertically upon the front of the spinal column behind the windpipe, traverses the chest in the posterior mediastinum upon the front of the spine, perforates the diaphragm together with the pneumogastric nerves, and ends at the cardiac orifice of the stomach, opposite the ninth dorsal vertebra. It is nearly straight, but has a slight curvature both anteroposteriorly and laterally. Its surgical relations are very important, especially in the neck. The esophagus has two principal coats. The muscular coat is composed of two planes of contractile fibers, the outer longitudinal and the inner circular. They are continuous above with fibers of the inferior constrictor of the pharynx. The muscles in the upper part of the esophagus are red and in part at least striped, but below are pale, unstriped, and "involuntary." The mucous coat is internal, continuous with that of the pharynx above and the stomach below. It is thick, of a reddish color above and paler below, disposed in longitudinal folds or plicae, which disappear on distention. Its surface is studded with minute papillae and invested throughout with stratified pavement epithelium. The mucous and muscular coats are loosely connected with each other by a layer of connective tissue, sometimes described as the *areolar coat*, between which and the mucous membrane is a layer of longitudinal unstriped muscular fibers called the *muscularis mucosae*. The esophagus is well supplied with glands called *esophageal* (which see, and see cuts under *alimentary, diaphragm, and mouth*). In lower animals the esophagus, as a canal from the mouth or fauces to the stomach, under-

goes numberless modifications of relative size, of shape, structure, and position. It very often presents special dilations, as the crop or craw of birds, and its lower end, where it enters the stomach, may present special contrivances for conducting food and drink, as the esophageal groove of a ruminant. Special aggregations of esophageal glands are also found.

There grew up, in the minds of some commentators, a supposition of exoteric doctrine as denoting what Aristotle promulgated to the public, contrasted with another secret or mystic doctrine reserved for a special few, and denoted by the term *esoteric*; though this term is not found in use before the days of Lucian. I believe the supposition of a double doctrine to be mistaken in regard to Aristotle; but it is true as to the Pythagoreans, and is not without some colour of truth even as to Plato.

He [Josephus] fanned himself to have learned all, whilst in fact there were secret *esoteric* classes which he had not so much as suspected to exist.

Dr Quincey, Secret Societies, ii.

When there exist two distinct explanations, or statements, about the significance of an emblem, the true one *esoteric*, and known only to the few, the other *exoteric*, incorrect, and known to the many, it is clear that a time may come when the first may be lost, and the last alone remain.

esquire¹ (es-kwīr'), *n.* [*< OF. esquier, esquier, esquier, an esquire, shield-bearer, also a shield-maker, mod. F. écuyer = Pr. escudier, escuder, escuier = Sp. escudero = Pg. escudeiro = It. scudiere, scutiero, < ML. scutarius, a squire, a shield-bearer, shield-maker, < L. scutum, a shield: see scutum, scute, scutage, escutcheon, scutcheon, etc.* Hence, by aphoresis (though actually older in E.), *squire, q. v.*] 1. A shield-bearer or armor-bearer; an armiger; an attendant on a knight. See *squire*¹, l. 2. A title of dignity next in degree below that of *knight*. In England this title is properly given to the eldest sons of knights and the eldest sons of the younger sons of noblemen and their eldest sons in succession, officers of the king's courts and of the household, barristers, justices of the peace while in commission, sheriffs, gentlemen who have held commissions in the army and navy, etc. There are also esquires of knights of the Bath, each knight appointing three at his installation. The title is now usually conceded to all professional and literary men. In the United States the title is regarded as belonging especially to lawyers. In legal and other formal documents *Esquire* is usually written in full after the names of those considered entitled to the designation; in common usage it is abbreviated *Esq.* or *Esqr.*, and appended to any man's name as a mere mark of respect, as in the addresses of letters (though this practice is becoming less prevalent than formerly). In the general sense, and as a title either alone or prefixed to a name, the form *Squire* has always been the more common in familiar use. See *squire*.

I am Robert Shallow, sir; a poor esquire of this county, and one of the king's justices of the peace.

Shak., 2 Hen. IV., iii. 2.

Esquires and gentlemen are confounded together by Sir Edward Coke, who observes that every *esquire* is a gentleman, and a gentleman is defined to be one qui arma gerit, who bears coat-armour, the grant of which was thought to add gentility to a man's family. It is indeed a matter somewhat unsettled what constitutes the distinction, or who is a real *esquire*; for no estate, however large, per se confers this rank upon its owner.

1 *Broom and Had. Com.* (Wait's ed.), p. 317.

The office of the *esquire* consisted of several departments; the *esquire* for the body, the *esquire* of the chamber, the *esquire* of the stable, and the curving *esquire*; the latter stood in the hall at dinner, carved the different dishes, and distributed them to the guests.

Strutt, Sports and Pastimes, p. 10.

It makes an important practical difference to an Englishman, by the way, whether he is legally rated as *Esquire* or "Gentleman," the former class being exempt from some burthensome jury duties to which the latter is subject.

C. A. Bristed, English University, p. 408, note.

3. A gentleman who attends or escorts a lady in public.—*Esquire bedel*. See *bedel*.

As to the tender question of *esquirearchy*, I am convinced that the only prudent principle now is to bestow the envied title on every one alike.

ess, es¹ (es), *n.* [*< ME. es, ess, < AS. ess, < L. es, the name of the letter S, s, < e, the usual assistant vowel in forming the names of letters, + s.*] 1. The name of the letter *S, s*. It is rarely so written, the symbol *S, s*, being used in its stead.—2. A large worm: so called from its often assuming the shape of an *S*. [Prov. Eng.]

essay (es'ā, formerly e-sā'), *n.* [The older E. form is *assay*, *q. v.*; < ME. *assay, assay, assai, assie*, trial, attempt, < OF. *assai, essai, assai* (later only *essai*, > later E. *essay*), mod. The Gr. ἔσασσιον, sometimes quoted as the origin of the L. *exagium*, is rare in Gr., and is taken from the L. term; it denotes a certain weight, 1½ drachmæ. Popular etym. altered the form to ἔσασσιον, as if < ἔσ = E. *sir*.] 1. A trial, attempt, or endeavor; an effort made; exertion of body or mind to perform or accomplish anything; as, an *essay* toward reform; an *essay* of strength.

In *lit.*, a discursive composition concerned with a particular subject, usually shorter and less methodical and finished than a treatise; a short disquisition: as, an *essay* on the life and writings of Homer; an *essay* on fossils; an *essay* on commerce.

To write just treatises requireth leisure in the writer and leisure in the reader, . . . which is the cause that hath made me choose to write certain brief notes, set down rather significantly than curiously, which I have called *Essays*. The word is late, but the thing is ancient.

Bacon, To Prince Henry.

Seneca's Epistles to Lucilius, if one mark them well, are but *Essays*, that is dispersed meditations, though conveyed in the form of epistles.

E. A. Abbott, Bacon, p. 438.

The *essay* is properly a collection of notes, indicating certain aspects of a subject, or suggesting thought concerning it, rather than the orderly or exhaustive treatment of it. It is not a formal piece, but a series of assaults, essays, or attempts upon it. It does not pursue its theme like a pointer, but goes hither and thither like a bird to find material for its nest, or a bee to get honey for its comb.

British chariots have been described by Roman historians as consisting of two kinds, called respectively the *covina* and the *essedā*; this last from *esse*, a Celtic word. The former was very heavy and armed with scythes, the latter much lighter, and consequently better calculated for use in situations where it would be difficult to employ the *covina*.

E. M. Stratton, World on Wheels, p. 250.

essence (es'ens), *n.* [= D. *essence* = G. *essenz* = Dan. Sw. *essens*, < F. *essence* = Pr. *essencia* = Sp. *esencia* = Pg. *essencia* = It. *essenzia* (obs.), *essenza*, < L. *essentia*, the being or essence of a thing, an artificial formation from *esse* (as if < **essen(t)-s*, ppr.), to translate Gr. *oûsia*, being, < ὄν (ovr-), ppr. of εἶναι = L. *esse*, be; see *am* (under *be*), and *ens*, entity.] 1. The inward nature, true substance, or constitution of anything. The Greek *oûsia* (see the etymology) denotes a subject in *esse*, something whose mode of being corresponds to that of a subject, as distinguished from a predicate, in speech. But while this is the original conception, the word *essence*, even in Latin, usually carries a different sense. The *essence* is rather the idea of a thing, the law of its being, that which makes it the kind of thing that it is, that which is expressed in its definition. In regard to artificial things, the conception of an *essence* is usually tolerably clear; thus, the *essence* of a bottle is that it should be a vessel with a tubular orifice. Those philosophers who speak of the *essences* of natural things hold that natural kinds are regulated by similar ideas. Nominalists hold that definitions do not belong to things, but to words; and accordingly they speak of the *essences* of words, meaning what is directly implied in their definitions.

Justice in her very *essence* is all strength and activity.

Milton, Eikonoklastes, xxviii.

First, *essence* may be taken for the being of anything, whereby it is what it is. And thus the real internal, but generally in substances unknown, constitution of things, whereon their discoverable qualities depend, may be called their *essence*. . . . Secondly, . . . but, it being evident that things are ranked under names into sorts or species only as they agree to certain abstract ideas, to which we have annexed those names, the *essence* of each genus or sort comes to be nothing but that abstract idea which the general or sortal (if I may have leave so to call it from sort, as I do general from genus) name stands for. And thus we shall find to be that which the word *essence* imports in its most familiar use. These two sorts of *essences*, I suppose, may not unfitly be termed, the one the real, the other the nominal, *essence*.

Locke, Human Understanding, III. iii. 15.

Whatever makes a thing to be what it is, is properly called its *essence*. Self-consciousness, therefore, is the *essence* of the mind, because it is in virtue of self-consciousness that the mind is the mind—that a man is himself.

Perrier.

But when in heaven she shall his *essence* see,

5. An elementary ingredient or constituent; anything uncompounded: as, the fifth *essence* (that is, the fifth element in the philosophy of Aristotle, or the upper air, the other four being, in their order, earth, water, air, and fire). See *quintessence*.

Bacon.

6. Anything of ethereal, pure, or heavenly substance; anything immaterial. [This meaning is derived from the use of *fifth essence* for the ether or upper air (see def. 5).]

As far as gods and heavenly *essences*

7. Any kind of matter which, being an ingredient or a constituent of some better-known substance, gives it its peculiar character; an extract; especially, an oil distilled at a comparatively low temperature from a plant in which it already exists: as, *essence* of peppermint. The scales are taken from the fish, left in water until the slimy matter adhering to them settles, then rubbed down in a mortar

with fresh water, and strained through a linen cloth. Ammonia is added, both to prevent decomposition and, by its volatilization, to aid in coating the pearls, whether the nacreous film is to be on the interior surface of a blown pearl or on the exterior of a bead of glass or paste, as for Chinese or Roman pearls.

Essenes (e-senz'), *n. pl.* [Formerly also *Essens*; < LL. *Esseni*, < Gr. *Ἐσσηνοί*, also *Ἐσσαίοι*, the Essenes. The origin of the name is unknown. See *Assidean*.] A community of Jews in Palestine formed in the second century B. C., originally representing a tendency rather than constituting an organized sect, and aiming at a higher degree of holiness than that attained by other Jews. Later they were organized into a sort of monastic society, bound together by oaths to piety, justice, obedience, honesty, and secrecy. According to Philo, their conduct was regulated by three rules—"the love of God, the love of virtue, and the love of man." They rejected animal sacrifices, but were strict in their observance of the non-Levitical Mosaic law. They were ascetics and generally celibates. They never extended, as a body, beyond the bounds of Palestine, and disappeared after the destruction of Jerusalem.

6. See *established church*, under *church*.

The essence of an Establishment seems to be that it is maintained by law, which secures the payment of its endowments, securing from the soil, or produce of the country.
Bp. Chr. Wordsworth, Church of Ireland, p. 295.

The church is accepted by the state as the religious body in England which is the legitimate possessor of all property set apart and devoted to religious uses, except the rights of some other religious body be specially expressed. . . . Its rights are carefully guarded by law. . . . This position of the church towards the state is called its Establishment. It has arisen not from any definite act of parliament or the state, but from the gradual interpenetration of the state by the church, and from their having mutually grown up together.

7. The quota or number of men in an army, regiment, etc.: as, a peace establishment.—**Establishment of the port**, the mean interval between the time of high water at any given port and the time of the moon's passing the meridian immediately preceding. Whose life in low estate began
And on a simple village green?

3. Rank; quality; status.

Who hath not heard of the greatness of your estate?

He [the chancellor] had said . . . that "if he had done anything that touched the king in his sovereign estate, he would not answer for it to any person alive save only to the king when he came to his age."

Generydes (E. E. T. S.), l. 18.

5. In law: (a) The legal position or status of an owner, considered with respect to his property; ownership, tenancy, or tenure; property in land or other things. When the thing in question is an immovable, such as land, etc., the estate, if a fee, or for a life or lives, is termed *real*. (See *real*.) If it is only for a term of years, or relates only to movables, it is termed *personal*.

Land was once not regarded as property at all. People owned not the land, but an *estate* in the land; and these *estates* still continue to haunt, like ghosts, the language of real property law.

Sir J. F. Stephen, National Rev., Laws relating to Land.

(b) More technically, and with relation only to land, the degree or quantity of interest, considered in respect to the nature of the right, its period of duration, or its relation to the rights of others, which a person has in land. If that interest, in a given case, does not amount to an absolute entire ownership, it is because there is at the same time another interest in the same thing pertaining to other persons. Thus, one man may have the ultimate right of property, another the right of possession, and a third actual possession: each of these interests being *qualified* or *incomplete estates*, which, if transferred to and merged in one person, would constitute an *absolute estate* or fee simple. (See *merger*.) Such special estates are said to be carved out of the fee. A *future estate*—that is, one which is not to be enjoyed until a future time—is nevertheless deemed to have a present existence in anticipation, even if it may never take effect, or if it is wholly uncertain who will be its owner; it is, in such case, called a *contingent estate*. *N. Y. Rev. St., III. 2175, § 5.*

The grant of land to a man, without specifying what *estate* he is to take, will to this day give him no interest beyond his own life. *P. Pollock, Land Laws, p. 55.*

6. Property in general; possessions; particularly, the property left at a man's death: as, at his death his *estate* was of the value of half a million; the trustees proceeded to realize the *estate*.

Which charge of feeding so many beastly [beasts'] months is able to eat up a countryman's *estate*.

The Great Frost (Arber's Eng. Garner, l. 89).

7. A piece of landed property; a definite portion of land in the ownership of some one: as, there is more wood on his *estate* than on mine.

No need to sweat for gold, wherewith to buy
Estates of high-priz'd land. *Quarles, Emblems, v. 9.*

But that old man, now lord of the broad *estate* and the Hall,

8†. The body politic; state; commonwealth; public; public interest.

... sends his Ambassadors to forren Princes, in the affairs of *estate*.

Bacon, Title of Essay.

I call matters of *estate* not only the parts of sovereignty, but whatever introduceth any great alteration, or dangerous precedent, or concerneth manifestly any great portion of people. *Bacon, Essays.*

9. One of the orders or classes into which the population of some countries is or has been divided, with respect to political rights and powers. In modern times this division has been into nobility, clergy, and people (now, in Great Britain, lords temporal and spiritual and commons), called the *three estates*. Formerly in France a legislative assembly representing the three estates, called the *states-general*, was summoned only in emergencies; the last began the revolution of 1789.

When the crowned Northman consulted on the welfare of his kingdom, he assembled the *estates* of his realm. Now an *estate* is a class of the nation invested with political rights. There appeared the *estate* of the clergy, of the barons, of other classes. In the Scandinavian kingdom to this day the *estate* of the peasants sends its representatives to the diet. *Disraeli.*

The United Kingdom of Great Britain and Ireland is governed by its king or queen and two Houses of Parliament. These are commonly known as the "Three *Estates* of the Realm"; but this phrase properly applies to the three classes of which Parliament is composed, viz., the Lords Spiritual, the Lords Temporal, and the Commons.

A. Fonblanque, How we are Governed, p. 11.

10†. A person of high station or rank; a noble. Richard, Duke of Gloucester, [was] . . . hardy favoured of visage, such as in *estates* is called a warlike visage, and among common persons a crabbed face.

Quoted in N. and Q., 7th ser., II. 314.

She is a dutchess, a great *estate*. *Latiner.*

Herod on his birthday made a supper to his lords, high captains, and chief *estates* [revised version, *men*] of Galilee. *Mark vi. 21.*

Cap of estate. Same as *cap of maintenance* (which see, under *maintenance*).—**Cloth of estate.** See *cloth*.—**Conditional estate, or estate upon condition,** an estate the existence of which depends upon the happening or not happening of some uncertain event, whereby the estate may be either originally created or enlarged, or finally defeated. *Blackstone. See condition, 8.*—**Conventional estates.** See *conventional*.—**Convention of estates.** See *convention*.—**Equitable estate or title,** a right to claim the profits or enjoyment of ownership from the person who holds the legal title as trustee; a beneficial interest, recognized by courts of equity as belonging to one person, while the legal title—that is, the title recognized by courts of common law—is in another person. Thus, sometimes a trustee is said to hold the legal title to the trust property, and the beneficiary an equitable estate or title.—**Estate at will,** that estate held by one who is in possession of the land of another by his consent, and holds it at the will of the latter, or at the will of both parties.—**Estate by statute.** See *statute*.—**Estate by sufferance.** See *sufferance*.—**Estate by the courtesy.** See *courtesy of England (under courtesy)*.—**Estate for life,** an estate limited to a man to hold the same for the term of his own life, or for that of any other person, or for more lives than one. (*Stephen*.) When used without qualification, the phrase usually implies tenancy for one's own life.—**Estate for years,** an estate which, by the terms of its creation, is measured by the lapse of a specified period of time (it may be a fraction of a year or more), so that it must expire by a certain date. An *estate for years* is often called a *term*.—**Estate in common.** See *tenancy*.—**Estate in expectancy.** See *expectancy*.—**Estate in fee.** See *fee*.—**Estate in joint tenancy,** an estate held, whether in fee, for life, for years, or at will, by several persons jointly (as distinguished from an *estate in severalty*, or held separately). Its characteristics are that it was created as a single estate, and must therefore owe its origin to one act or deed (*unity of title*), the interest of each commencing at the same time (*unity of time*), and the possession of either being legally equivalent to the possession of all (*unity of possession*). It follows from these qualities that on the death of one the entire estate remains in the others, who are said to take by *right of survivorship*. A conveyance by one of his interest terminates the joint character of the interest conveyed, because the unities are not preserved, and the transferee, if a stranger, is a tenant in common. To illustrate the distinction, trustees hold as joint tenants, heirs as tenants in common. See *tenancy*.—**Estate in possession.** See *possession*.—**Estate in severalty.** See *severalty*.—**Estate in tail,** an estate in fee cut down (*taille*) by restricting it to certain descendants or classes of descendants, leaving usually a right of reversion in the creator of the estate, in the event of the failure of such descendants. See *tail* and *entail*.—**Estate of inheritance,** an estate that on the death of the owner survives, and if he dies intestate passes to his heirs. It may be applied to that which is unfavorable; as, my *estimate* of the man was not high. *Esteem* as a noun has commonly the favorable meanings of the verb; it is a moral sentiment made up of respect and

attachment, the result of the mental process of reckoning up the merits or useful qualities of a person: as, he is held in very general esteem. *Estimation* has covered the meanings of both *estimate* and *esteem*. *Respect* is commonly the result of admiration and approbation: as, he is entitled to our respect for his abilities and his probity; it emits, sometimes pointedly, the attachment expressed in *esteem*. *Regard* may include less admiration than *respect* and be not quite so strong as *esteem*, but its meaning is not closely fixed in quality or degree.

etch-grain (ech'grān), *n.* A crop sown in spring after plowing the stubble. [Prov. Eng.] See *eddish*, 2.

etching (ech'ing), *n.* [Verbal *n.* of *etch¹*, *v.*] 1. A process of engraving in which the lines are produced by the action of an acid or mordant instead of by a burin. A plate (usually of copper, but sometimes of glass, stone, etc., according to the use to which it is to be put, or the effect sought to be produced) is covered with a ground made of asphaltum, wax, and pitch, which is evenly blackened with the smoke of wax tapers. (See *etching-ground*.) On this ground the design is drawn with a steel point or needle, as with a pencil on paper (care being taken not to cut the metal), the point leaving the metal exposed where it passes. The plate is then submerged in a bath of dilute acid, which bites in those parts of the surface exposed by the drawn lines, while the remainder of the surface is protected from its action by the wax coating. Furrows are thus formed which, when the plate has been cleaned and charged with ink, will, if impressed upon a piece of moist paper, print an impression of the design. When blackened, the plate may be plunged into cold water to give its surface a polish. For copperplates to be used in printing, the mordant commonly used is nitric acid, but in its place some modern etchers employ a so-called "Dutch mordant," made of muriatic acid and chlorate of potash. When the fainter lines of the design appear to be sufficiently bitten in, the plate is taken from the bath and, after being carefully washed in cold water these lines are stopped out with a paint-brush charged with a varnish made of asphaltum and turpentine, so that they will be protected from the acid when the plate is replaced in it. This process is repeated from time to time until the strongest lines in the design have been sufficiently bitten in, after which the remaining ground is washed off with spirits of turpentine, and the plate is ready to be inked. Artists who *etch* from nature while the plate is in the acid bath proceed inversely—that is, they begin by biting in the stronger lines, and end with the fainter; but in either case, whether the latter are stopped out or last put in, they are subjected to a smaller degree of acid action. If the first impressions are imperfect, the plate can be retouched with the dry-point, or rebitten after a fresh ground has been laid on with a roller. The tools used in etching comprise needles, gravers or burins of different shapes, scrapers, burnishers, oil-rubbers, dabbers, camel's-hair brushes, etc. A surface of porcelain may be etched and bitten, and the sunken lines then filled with a metallic pigment which on refining can be burned into the ware and covered with glaze.

Some plates were sent abroad about the year 1530, eaten with aqua fortis after Parmesano; and *etching* with corrosive waters began by some to be attempted with laudable success. *Evelyn*, *Sculpture*.

2. An impression taken from an etched plate.—3. A line etched, or appearing as if etched. [Rare.]

Never is my imagination so busy as in framing his responses from the *etchings* of his countenance. *Sterne*, *Tristram Shandy*, vii. 32.

Calligraphic etching, a process consisting in drawing with a pen dipped in common ink on a well-cleaned copperplate. When the ink is dry the plate is covered with a thin etching-ground, and afterward smoked. It is then left for a quarter of an hour in a bath of cold water, which softens the ink, so that when on removal from the bath the surface is gently rubbed with a piece of flannel, the ink and the varnish over it will come away together, leaving the design clearly traced in bright lines on the copper, to be bitten in as usual.—**Etching-embroidery**, a kind of fancy-work done with black silk and with water-color, such as sepia and India ink, upon a light silk ground, in imitation of prints from engravings and etchings. It was very much in fashion during the early part of the nineteenth century.—**Etching figure**. See *figure*.—**Painter's etching**, a phrase used to designate an etching which in first conception, composition, delineation, and mechanical execution is entirely the work of one artist, as opposed to an etching executed after a design or picture by another artist.—**Soft-ground etching**, also called *gravure en manière de crayon*, an etching executed by covering a plate with a ground made of equal parts of

the ordinary etching-ground and tallow, or, in summer, of two thirds of the first and one third of the second, melted together, which, when cooled, is rolled into balls wrapped in silk. After laying the ground and anointing it lightly, a piece of thin paper with a grain is laid upon it, on which a design is drawn with a lead-pencil. As the varnish attaches itself to the paper in proportion to the pressure of the hand, when the paper is lifted the lines traced by the pencil are exposed upon the plate, and when bitten in will yield a facsimile impression of the design.

etching-ground (eeh'ing-ground), *n.* The varnish or coating used in etching to protect the surface of the metal plate from the action of the mordant. An ordinary ground is made of 2 ounces of natural or Egyptian asphaltum, 1½ ounces of virgin wax, and 1 ounce of Burgundy pitch. These ingredients are melted over a slow fire, thoroughly compounded, and, while still pliant, rolled into balls for use. A transparent ground for retouching is made of 5 parts of white wax, to which, when melted, 3 parts of gum mastic in powder have been added; or of 1 ounce of resin and 2 ounces of wax, set to simmer over a fire in a glazed pipkin; or of turpentine varnish with a small quantity of oil of bismuth.

etching-needle (eeh'ing-nē'dl), *n.* A sharp instrument of steel for tracing outlines, etc., on plates to be etched. Needles for use in etching proper are sharpened perfectly round and are of several degrees of fineness; those used in etching with the dry-point are sharpened on a flat hone but not strapped, so as to produce a cutting angle on one side of the point.

etching-point (eeh'ing-point), *n.* A steel or diamond point employed in etching; an etching-needle.

3. In a special metaphysical use, existing outside of all relations of time; independent of all time-conditions; not temporal.

For there were no days and nights and months and years before the heaven was created, but when he created the heaven he created them also. All these are the parts of time, and the past and future are created species of time, which we unconsciously but wrongly transfer to the *eternal* essence; for we say indeed that he was, he is, he will be, but the truth is that "he is" alone truly expresses him, and that "was" and "will be" are only to be spoken of generation in time.
Plato, Timæus (trans. by Jowett), § 33.

4. By hyperbole, having no recognized or perceived end of existence; indefinite in duration; perpetual; ceaseless; continued without intermission.

Bryant, Sella.

Eternal generation, in *theol.*, the communication of the divine essence from God the Father to God the Son. The Catholic, orthodox, or Trinitarian doctrine is that God the Son, being truly God equally with God the Father, is existent from all eternity to all eternity, and that accordingly God has always existed as Father and as Son, so that the divine act of generation is itself eternal, that is, never had a beginning and can never have an end. This doctrine is opposed to the Arian teaching that "there was [a time] when he [the Son] was not," and that "before being begotten he was not." As involving paternity and filiation, the act by which the Son proceeds from the Father is distinctively called *begetting* or *generation*, while that by which the Holy Ghost proceeds from the Father (according to John xv. 26 and the terminology of the Eastern Church), or from the Father and the Son (in the language of Western theology), is called *procession* simply, or distinctively *spiration*. = *Syn. Eternal, Everlasting, Immortal, Perpetual*; interminable, perennial, imperishable. *Eternal* primarily means without beginning or end, but secondarily without end; *everlasting* properly means lasting from the present to an endless future. Both *eternal* and *everlasting* are peculiarly associated with the divine being or function. *Immortal* applies to that which cannot or will not die: as, "*immortal* hate," *Milton, P. L., i. 104*; "married to *immortal* verse," *Milton, L'Allegro, l. 137*. It is sometimes applied to God (1 Tim. i. 17). *Perpetual* points to the future, and applies especially to that which is established: as, a *perpetual* covenant, desolation, feud. It is freely applied to anything that lasts indefinitely. All the four words are often used by hyperbole for that which has long duration. See *incessant*.

What can it then avail, though yet we feel
Strength undiminish'd, or *eternal* being,
To undergo *eternal* punishment?

2. In *astron.* and *physics*, a hypothetical medium of extreme tenuity and elasticity supposed to be diffused throughout all space (as well as among the molecules of which solid bodies are composed), and to be the medium of the transmission of light and heat. See the *extract*.

The phenomena of Light are best explained as those of undulations; but undulations, even in the most extensive use of the term, as signifying any periodic motion or condition whose periodicity obeys the laws of wave motion, must be propagated through some medium. Heat, while passing through space, presents exactly the same undulatory character, and requires a medium for its propagation. Electrical attraction and repulsion are explained in far the most satisfactory way by considering them as due to local stresses in such a medium. Current electricity seems due to a throb or series of throbs in such a medium, when released from stress. Magnetic phenomena seem due to local whirlpools, set up in such a medium. . . . We are led to infer, therefore, that there is such a medium, which we call the *Luminiferous Ether*, or simply the *Ether*; that it can convey energy; that it can present it at any instant, partly in the form of kinetic, partly in that of potential energy; that it is therefore capable of displacement and of tension; and that it must have rigidity and elasticity. Calculation leads us to infer that its density is (Clerk Maxwell) that of water, or equal to that of our atmosphere at a height of about 210 miles, a density vastly greater than that of the same atmosphere in the interstellar spaces, and that its rigidity is about that of steel; hence, that it is easily displaceable by a moving mass, that it is not discontinuous or granular, and hence that as a whole it may be compared to an impalpable and all pervading jelly through which Light and Heat waves are constantly throbbing, which is constantly being set in local strains and released from them, and being whirled in local vortices, thus producing the various phenomena of Electricity and Magnetism, and through which the particles of ordinary matter move freely, encountering but little retardation, if any, for its elasticity, as it closes up behind each moving particle, is approximately perfect.

A. Daniell, Prin. of Physics, p. 208.

ethics (ē'th'iks), *n.* [Pl. of *ethic* (see *-ics*), after *Gr. ἠθικά*, neut. pl., *ἠθικός*, fem. sing., ethics: see *ethic*.] 1. The science of right conduct and character; the science which treats of the nature and grounds of moral obligation and of the rules which ought to determine conduct in accordance with this obligation; the doctrine of man's duty in respect to himself and the rights of others. Kant distinguishes between pure morals, or the science of the necessary moral laws of a free will, and ethics properly so called, which considers those laws as under the influence of sentiments, inclinations, and passions to which all human beings are more or less subject.

This fable seems to contain a little system of morality; so that there is scarce any better invention in all ethics.

Bacon, *Fable of Dionysius*.

Ethics may either be regarded as an inquiry into the nature of the Good, the intrinsically preferable and desirable, the true end of action, &c.: or as an investigation of the Right, the true rules of conduct, Duty, the Moral Law, &c. H. Sidgwick, *Methods of Ethics*, p. 2.

Professor Birks came nearer a satisfying definition when he said that *Ethics* is the science of ideal humanity—the only objection to it being that it does not necessarily imply self-determination and obligation.

The Ethiopians of Homer are mythical; later the term came to imply a negro, a blackamoor, and popular etymology, followed by modern writers, derived the name from *αἰθρ*, *buru* (or *αἰθρ*, *burnt*), + *ὄψ*, *ὄψ*, eye, face; as if 'the Burnt-Faces' (cf. *αἰθρ*, fiery-looking, flashing, sparkling, fiery, hot, in *LGr.* also swart, black, < *αἰθρ*, burnt, fiery, + *ὄψ*, face); but the form *Αἰθίοψ* would not result from such composition, and it is probably a corruption of some Egyptian or African original.] 1. Sieve-like; cribriform: in anatomy specifically applied to a bone of the skull. See *II.* — 2. Specifically, pertaining to the ethmoid: as, the *ethmoid* region of the skull.

II. n. A bone of the cranium, situated in the middle line of the skull, in advance of the sphenoid, above the basiscranial axis, transmitting the filaments of the olfactory nerve, and constituting the bony skeleton of the organ of smell: so called because, in the human subject and mammalia generally, it has a cribriform plate perforated with numerous holes for the passage of the olfactory nerves. The human ethmoid is comparatively small, of a cubical figure, with its cribriform plate horizontal. It consists of a median perpendicular plate or mesethmoid, and of the horizontal or cribriform plate, from which latter the main body of the bone depends on either side, forming the so-called lateral masses, or ethmoturbinals. The texture of these is extremely light and spongy, full of large cavities connecting with the frontal and sphenoidal sinuses, and lined with mucous membrane, the Schneiderian membrane, upon which the olfactory nerves ramify after leaving the cavity of the cranium through the holes in the cribriform plate. (See cut under *nasal*.) The so-called os planum of the ethmoid is simply the exterior surface of these lateral masses, which contributes to the inner wall of the orbit of the eye. The lateral masses are each partially divided into two, called the superior and middle turbinate bones, or scroll-bones (the inferior turbinate being a different bone), which respectively overlie the corresponding nasal meatuses. (See cut under *mouth*.) The ethmoid is wedged into the ethmofrontal notch of the frontal bone, and also articulates with the vomer, sphenoid, sphenoturbinals, nasals, maxillaries, lacrymals, palatals, and maxilloturbinals. It is developed from three ossific centers, one for the perpendicular plate, and one for each lateral mass. In other animals the ethmoid exhibits a wide range of variation in size, shape, and connections, and below mammals loses much or all of the particular characters it presents in man. (See cut under *Esox*.) It is relatively larger and more complicated in mammals of keen scent, as carnivores and ruminants.

ethmoidal (ēth'moi-dal), *a.* [*ethmoid* + *-al*.] Pertaining to the ethmoid. — **Anterior ethmoidal canal**, a canal formed from a groove on the anterior part of the ethmoidal edge of the orbital plate of the frontal bone by articulation with the ethmoid. It transmits the nasal branch of the ophthalmic nerve and the anterior ethmoidal vessels. — **Ethmoidal foramina**. See *foramen*. — **Posterior ethmoidal canal**, a canal formed from a groove on the posterior part of the ethmoidal edge of the orbital plate of the frontal bone by articulation with the ethmoid bone. It transmits the posterior ethmoidal vessels.

Etruscan (ē-trus'kan), *a.* and *n.* [*< L. Etruscus*, Etrurian (pl. *Etrusci*, the Etrurians), *< Etruria*, Etruria. Hence nlt. *Tuscan*, *q. v.*]

I. *a.* Pertaining or relating to Etruria, an ancient country in central Italy, bordering on the part of the Mediterranean called the Tyrrhenian sea, between Latium and Liguria (including modern Tuscany), or to its inhabitants, and especially to their civilization and art. These, before Hellenic influence was actually felt in Etruria, resembled in many ways those of primitive Greece. Compare *Tuscan*.—**Etruscan art**, the art of ancient Etruria; an artistic development believed with probability to have grown up independently from the same root as the art of Greece, but far inferior in every way to Greek art, though in its later stages influenced by it. Etruscan masonry closely resembles the Greek in its progress from the massive polygonal to admirable rectangular work in even courses; the arch and the vault were consistently employed, and were passed on to become the characteristic feature of Roman architecture; while the Etruscan house of rectangular plan with central court was the prototype of the Roman house. (See *Tuscan order*, under *Tuscan*.)

Etruscan Art.—Etruscan Sarcophagus in terra-cotta, from Chiusi: period of full development.—Museo Egizio, Florence.

The best works of Etruscan sculpture were its strongly colored terra-cotta statues, of life-size and larger, and its sarcophagi of terra-cotta bearing reclining figures on their lids, showing, however, but little anatomical truth, despite much research in details of dress and ornament. The native Etruscan jewelry exhibits massiveness and intrinsic value, as in heavy and complicated chains, pendants, and the like, in preference to the delicacy and artistic refinement of the imported Greek and Phœnician examples found with the native productions in the tombs. See *bullæ*.—**Etruscan pottery**. (a) The pottery of the ancient Etruscans, which may be roughly divided into four main classes: (1) the early cinerary urns, called *Canopic vases*, with covers in the form of human heads (see *Canopic*); (2) the black, unglazed ware, with ornamental figures and designs, impressed or in low relief, called *bucchero* or *bucchero nero vases* (see *bucchero*); (3) the painted vases imitated more or less closely from those of Greek manufacture; (4) the vases coated with a brilliant black varnish, and bearing reliefs, called *Etrusco-Campanian* (which see). (b) An epithet erroneously applied to Greek painted vases. This application, originating in the eighteenth century, before the study of archaeology had made much advance, is still in use among persons whose ideas about these subjects are obtained from books. Wodgwood had this use in mind when he named his works *Etruria*.—**Etruscan ware**, a pottery made by a person named Dillwyn, at Swansea in Wales, about 1850, and decorated with figures, borders, etc., of classical design, usually in black or red. This ware was known as *Dillwyn's Etruscan ware*, and these words were printed in black on the bottom of each piece. *Jewitt*.

II. *n.* 1. An inhabitant of Etruria; a member of the primitive race of ancient Etruria.

The Etruscans were distinguished ethnologically from all neighboring races, and their affinities are unknown, though there were similar people in ancient Rhætia, Thrace, etc. They called themselves *Rasena*, and the Greeks called them *Tyrrhenians*, between which and *Etruscans* there is probably a philological connection. See *Tyrrhenian*.

2. The language of the Etruscans, which from its few remains appears to have been unlike any other known tongue. It was spoken by many people in Italy outside of Etruria, till gradually superseded by Oscan and Latin; but a form of it continued in use in Rhætia (the Grisona and Tyrol) several centuries longer.

Etrusco-Campanian (ē-trus'kō-kam-pā'nian), *a.* Pertaining to Etruria and Campania, of ancient Italy.—**Etrusco-Campanian pottery**, the latest class of Etruscan pottery, made also in Campania, in the third century B. C. and later. The vases of this class are coated with a brilliant black varnish, present a great diversity of forms, and, like the older *bucchero* vases, affect shapes more appropriate to metal than to clay. All bear ornament in relief, from simple ribs or flutings to medallions, groups of figures, etc.

Etrusco-Campanian Vase.

Etymology treats of the structure and history of words. It includes classification, inflection, and derivation.
F. A. March, Anglo-Saxon Grammar, p. 33.

Specifically—**2.** The particular history of a word, including an account of its various forms and senses. In its widest sense, the etymology of a word includes all its variations of form and spelling, and all its different meanings and shades of meaning, from its first appearance in the language to the present time, and, further, the same facts concerning the original or the cognate forms of the word in other languages. This would be impracticable for any large number of words, and accordingly the fullest etymologies, as in this dictionary, give but one form or a few typical forms for a given period of a language, or but one form for the whole period of the language, with a like summary treatment of the meanings, a more complete exhibition of forms and meanings being given only at critical or important points in the history. In a very restricted but common acceptance, the word implies merely the "derivation" of the word, namely, the mention of the word or root from which it is derived, as when **bishop** is said to be "from Greek **ἐπίσκοπος**," or **chief** "from Latin **caput**."

Expounding also and declaring the **etimologie** and native signification of such words as we have borrowed of the Latines or Frenche menne, not evyn so comonly used in our quotidiane speche.
Quoted in *Babees Book* (E. E. T. S.), p. xxi.

This terme [barbarous] being then so used by the ancient Greekes, there have bene since, notwithstanding, who have digged for the **Etimologie** somewhat deeper, and many of them have said that it was spoken by the rude and barking language of the Affricans now called Barbarians.
Pittenham, Arte of Eng. Poesie, p. 210.

Before attempting an **etymologie**, ascertain the earliest form and use of the word; and observe chronology. Observe history and geography; borrowings are due to actual contact. Observe phonetic laws.

Skeat, Etym. Dict., Pref., p. xxi.

The prefix is used in Greek primarily to form adjectives, the second element being usually a noun or verb root, and the compound being an adjective meaning 'with good . . .', 'having good . . .', 'well-' or 'easily'—ed, as in **εὐχεύω**, having good (quick, dexterous) hands, well-handed, **εὐφύης**, well-grown, having a good nature, **εὐώνυμος**, having a good name, well-named, **εὐάγγελος**, bringing good news, etc.; such adjectives being often used as nouns, and often having abstract or other nouns derived from them.] A prefix of Greek origin, meaning 'good' (for the purpose) or, as used adverbially, 'well', 'easily,' implying excellence, fitness, abundance, prosperity, facility, easiness. It is opposed to **dys-**, as in **εὐλογία**, **ευεπεία**, opposed to **δυσλογία**, **δυσπεία**. In **evangel** and its derivatives **eu-** has taken the form **ev-**, which also appears, less properly, in some recent New Latin formations.

euchre (ū'kēr), *n.* [Sometimes written *eucre*; the spelling is evidently corrupt. If of G. origin, as some-times said (with some probability; cf. *bow-cr6* in this game, of G. origin), it would per-haps represent a L.G. form **juker*, but no connection is made out. Cf. G. *jucks*, a joke (= E. *joke*), with E. *joker*, a certain card; L.G. *juch-hei*, a merry company, an exclamation of boisterous joy, = MHG. *juch*, > G. *jauchen*, shout.] 1. A game of cards play-ed by two, three, or four persons with the 32, 28, or 24 highest cards of the pack. Five cards are dealt to each player, two and then three at a time, or three and then two, and one to mark trumps is turned face up; the eldest hand has the right either of ordering this card into the dealer's hand, who discards another, and then playing the game, or of "passing"—that is, doing nothing; likewise the second and third hands if more than two play; should all pass, the dealer can take up into his hand the trump card, or can pass, which he does by turning down the card which had been turned face up; if the latter, the eldest hand either names a new suit as trumps, the game being then played through, or passes again. Should he pass, the second hand, the third hand, and the dealer in turn have the same right of naming the trump or passing. If all pass on this second round, then a new deal is made by the hand next in order. In playing the hands, each player throws one card, following suit if pos-sible, and the highest card takes the trick; the winning of three tricks counts one, of five tricks two; should a player on one side order up, take up, or name the trump and fail to secure at least three tricks, that side is euchred, and its opponent scores two. The cards rank from ace through king, queen, etc., to the lowest card used, except in trumps, where the knave, known as the right bower, is the highest, and the other knave of the same color, or left bower, is the next highest. Sometimes an addi-tional card, called the *joker*, which is the highest of all the cards, is used, the game being then known as *rail-road euchre*.

2. The winning of at least three tricks in a hand, in a game of euchre, from the side which makes the trump: as, that is a *euchre*.—**Cut-throat euchre**, three-handed euchre, in which one person plays against the other two together.—**French euchre**, a variety of the game of euchre played by four persons with the 24 highest cards of the pack. Each player, in turn, has the right of bidding, or offering to take a certain number of tricks, and that one who bids highest names the trump. The game then proceeds as in four-handed euchre. If the bidding player and his partner take the number of tricks proposed, they add that to their score; if not, their oppo-nents do.—**Progressive euchre**, a series of games of euchre played by three or more sets of four persons each. All the sets begin playing at the same time, and when those at the first or "head" table finish, those at the other tables must stop playing. Those who win or are ahead score one, and are advanced to the next table, except those already at the head table, who stay where they are. Those who lose or are behind stay where they are, except when at the first table, in which case they go back to the last or "booby" table. All who lose while at the last table score one as "boobies." At the end of the play prizes are given.—**Six-handed or bid euchre**, a variety of the game of euchre played by six persons (three on a side), with the joker and the 29, 32, or 34 highest cards of the pack. That player who bids or offers to make the most points names the trump. The game then proceeds as in four-handed euchre. If the player who bids and his part-ners secure the number of points proposed, they add it to their score; if not, it is counted for their opponents. When more than 30 cards are used, those not dealt are placed face down on the table, and are called "the widow"; the player who names the trump has the privilege of se-lecting such of them as he may wish, and using them in place of others discarded from his hand.

euchre (ū'kēr), *v. t.*; *pret.* and *pp. euchred*, *ppr. euchring*. [< *euchre*, *n.*] In the game of euchre, to win a hand over, when an opponent has ordered up, taken up, or named the trump, thus securing two points; hence, to turn the tables on; defeat; get the better of. See the noun.

euglenid (ū-glē-nid), *n.* An infusorian of the family *Euglenidae*.

Euglenidae (ū-glē-ni-dē), *n. pl.* [NL., < *Euglena* + *-idae*.] A large family of monomastigote eustomatous flagellate infusorians, typified by the genus *Euglena*, highly diversified or metabolic, with brilliant, usually green, endoplasm. These remarkable animalcules form a natural family, whose bright colors (for the most part green, though sometimes red) and peculiar endogenous multiplication (noted below) are highly characteristic. They vary much in the different genera, being free-swimming or sedentary, naked or loricate, and solitary or colonial. The flagellum is single and terminal; the oral aperture is distinct; the endoplasm often contains highly refractive particles of apparently amylaceous substance; one or more eye-like pigment-specks are often developed at the anterior end; and the contractile vacuole and the endoplast are conspicuous, the former usually located close to the anterior border. The euglenids multiply both by longitudinal and transverse fission, by the subdivision of the body-substance into sporular elements, and by the development of independent germinal bodies out of the substance of the endoplast. The sporulation, or breaking up of the colored endoplasm, usually consequent upon a process of encystment, results in the formation of germs variable in number and of irregular contour, released as small green amoebiforms, without trace of the flagellum, oral aperture, or pigment-spot, which are subsequently acquired. The fusiform zooids resulting from the sporulation of the endoplasm of motile euglenids, on the contrary, appear to be usually furnished with a flagellum and an eye-spot. Another form of encystment, not connected with reproduction, occurs in euglenids when the water dries up in the ponds or ditches where they live. The animalcules become spherical and quiescent, develop a gelatinous covering which indurates, and in this condition have been mistaken for green algae. These several changes of the animalcule give rise to the term *euglenoid*, applied to other organisms, as gregarines, which present similar conditions of encystment and sporulation. According to Saville Kent, the genera composing the family as at present recognized are *Euglena*, *Amblyopsis*, *Phacus*, *Chloropeltis*, *Trachelomonas*, *Rhopidomonas*, *Ceolomonas*, *Ascoelena*, and *Colacium*. Nearly all occur in fresh water, especially when stagnant, though a few are found in brackish water. They may be single or in small groups, or may form very extensive colonies.

Max Müller, *Sci. of Lang.*, 2d ser., p. 416.

Again very many Arab tribes are named after gods or goddesses, and the *euhemerism* which explains this by making the deity a mere deified ancestor has no more claim to attention in the Arab field than in other parts of the Semitic world.

(b) Later, the name of the portion of the eucharist sent to the sick, or by bishops to other bishops and churches as a token of Christian love. These practices were early discontinued, because of the growing reverence for the elements. (c) Later still, the name given to the unconsecrated bread not needed in the eucharist, but blessed and distributed as a substitute for the eucharist among those members of the congregation who, though they had the right to take the communion, did not commune. This custom still exists in the Greek Church. Also called *antidoron* (which see). Also *eulogy*.

As soon as Mass had been ended, a loaf of bread was blessed, and then, with a knife very likely set apart for the purpose, cut into small slices, for distribution among the people, who went up and received it from the priest, whose hand they kissed. eulogy (ū-lō-ji), *n.*; pl. *eulogies* (-jiz). [First in *ML. form eulogium* (> *OF. euloge*); later *eulogy* = *F. eulogie*, < *ML. eulogia* (a blessing, salutation,

2. Same as *eulogia*.

At Angers one Lent he [St. Malan] gave what is called the "*eulogie*" (sacred bread) to four bishops. *N. and Q., 7th ser., VI. 14.*

=*Syn.* 1. *Encomium, Eulogy, Eulogium, Panegyric*. These words are best understood through their history. (See the derivations.) *Eulogy* is stronger than *encomium*, but still is the most general word. An *encomium* is an expression of warm praise, of some feltness and completeness, like the ancient laudatory ode; *encomium* is not a distinctive name for a set speech; the others may be: as, Everett's *Eulogy* upon the Pilgrim Fathers; the *Panegyric* of Isocrates. *Eulogium* is only a more formal word for *eulogy*. The last three may be used abstractly, but not *encomium*; we may say, it was mere *eulogy* or *panegyric*, but not mere *encomium*. *Eulogy, a eulogy*, and an *encomium* may be tempered with criticism; *panegyric* and a *panegyric* are only praise; hence, *panegyric* is often used for exaggerated or indiscriminating praise.

Plutarch assures us that our author [Cicero] . . . made a speech in public full of the highest encomiums on Crassus. *Albion, tr. of Cicero, I. 5, note 3.*

Men with tears coursing down their cheeks in listening to his [Choate's] sonorous periods in his *eulogy* upon Webster yet silly made a memorandum that they would count the words in some of those periods when they should be printed. *A. Phelps, Eng. Style, p. 99.*

Collectors of coins, dresses, and butterflies have astonished the world with *eulogiums* which would raise their particular studies into the first ranks of philosophy. *I. D'Israeli, Lit. Char., p. 375.*

I think I am not inclined by nature or policy to make a *panegyric* upon anything which is a just and natural object of censure. *Burke, Rev. in France.*

This instinct of politeness in speech—*euphemism*, as it is called—which seeks to hint at an unpleasant or an indelicate thing rather than name it directly, has had much to do in making words acquire new meanings and lose old ones: thus 'plain' has usurped the sense of 'ugly'; 'fast,' of 'dissipated'; 'gallantry,' of 'licentiousness.'

Chambers, Inf. for the People.

Euphoniinae (ū-fō'ni-i-nē), *n. pl.* [NL., *< Euphonia* + *-inae*.] A subfamily of tanagers, having a short turgid bill, the upper mandible usually with terminal notch and also some slight serrature, a short tail, and certain peculiarities of the stomach. There are 4 genera, *Euphonia*, *Chlorophonia*, *Pyrrhuphonia*, and *Hypophonia*. Also *Euphoniinae*.

euphoniuous (ū-fō'ni-us), *a.* [*< LL. euphonia* (*< Gr. εὐφώνια*), euphony, + *-uous*. See *euphonus*.] Consisting of agreeable articulate elements; well-sounding; euphonic.

Euphoniuous languages are not necessarily easy of acquirement. The Fin, in which it is rare to find two concurrent consonants in the same syllable, is too fine and delicate for remembrance. The mind wants consonantal combinations, or something equally definite, to lay hold of.

Latham, *Elem. of Comp. Philol.*

euphoniuously (ū-fō'ni-us-li), *adv.* With euphony; harmoniously.

euphonism (ū-fō'nizm), *n.* [*< Gr. εὐφώνος*, euphonus (see *euphonus*), + *-ism*.] An agreeable sound or combination of sounds. *Oswald*. [Rare.]

euphonium (ū-fō'ni-um), *n.* [NL., *< Gr. εὐφώνος*, sweet-voiced, musical: see *euphonus*.] 1. A musical instrument, consisting of a set of glass tubes, connected with graduated steel bars, to be put in vibration by the moistened finger: invented by Chladni in 1790.—2. A musical instrument, the lowest or bass of the saxhorn family, having a compass of about three octaves upward from the second C below middle C. Its tone is powerful, but unsympathetic.

euphonize (ū-fō'niz), *v. t.*; pret. and pp. *euphonized*, ppr. *euphonizing*. [*< Gr. εὐφώνος*, having a good voice, sweet-voiced, musical (see *euphonus*), + *-ize*.] To make euphonic or agreeable in sound.

The spreading of classical learning had not at first that general effect in euphonizing our language which might have been expected.

Mitford, *Harmony of Language* (1774), p. 174.

euphonus (ū-fō'nus), *a.* [*< Gr. εὐφώνος*, having a good voice (i. e., having a sweet voice, as a singer, e. g., the Muses, or having a loud, distinct voice, as a herald) (appar. not used with ref. to easy or agreeable pronunciation), *< εὐ*, well, + *φώνη*, voice, sound: see *euphony*.] Same as *euphoniuous*. *Mitford*.

euphony (ū-fō'ni), *n.* [= F. *euphonie* = Sp. *eufonia* = Pg. *eufonia* = It. *eufonia*, *< LL. euphonia*, *< Gr. εὐφώνια*, the quality of having a good voice (i. e., a sweet or a loud voice), loudness of voice, euphony, *< εὐφώνος*, having a good voice: see *euphanous*.] 1. Easy enunciation of sounds; a pronunciation which is pleasing to the sense; agreeable utterance. As a principle active in the historical changes of language, *euphony* is a misnomer, since it is ease of utterance, economy of effort on the part of the organs of speech, and not agreeableness to the ear, that leads to and governs such changes.

Euphony, which used to be appealed to as explanation [of phonetic change], is a false principle, except so far as the term may be made an idealized synonym of economy [in utterance].

Whitney, *Encyc. Brit.*, XVIII. 773.

2. Harmonious arrangement of sounds in composition; a smooth and agreeable combination of articulate elements in any piece of writing.

Euphony consists, also, in a well-proportioned variety of structure in successive sentences. A monotonous repetition of any construction can not be made euphoniuous, except by singing it.

A. Phelps, *Eng. Style*, p. 327.

=Syn. *Euphony*, *Melody*, *Harmony*, *Rhythm*. *Euphony* in style respects simply the question of pleasing sounds in the words themselves. *Melody* respects the succession of sounds, especially as affected by the pitch appropriate to the thought and required by the arrangement of clauses. *Harmony* respects the adaptation of sound to sense. *Rhythm* respects the emphasis—that is, the succession of emphatic and unemphatic syllables. In music *melody* respects the agreeable combination of successive sounds of various pitch, while *harmony* respects the agreeable blending of simultaneous sounds of different pitch, the sounds in either case being from voices or musical instruments; thus, a song for children to sing must depend for its effect upon *melody* rather than *harmony*.

The Attic euphony in it, and all the aroma of age.

D. G. Mitchell, *Wet Days*.

The river that I sate upon
It made such a noise as it ran,
Accordant with the birds among,
Me thought it was the best melody
That might be heard of any mon.

Chaucer, *Cuckoo and Nightingale*, l. 81.

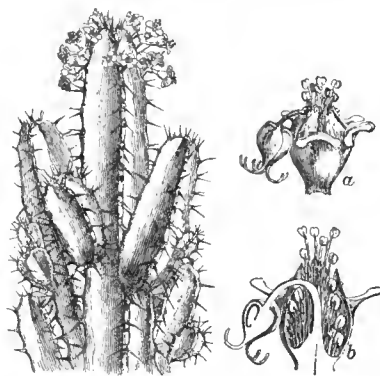

By the harmony of words we elevate the mind to a sense of devotion, as our solemn music, which is inarticulate poetry, does in churches.

Dryden, *Tyrannic Love*, Pref.

Ourself have often tried
Valkyrian hymns, or into rhythm have dash'd
The passion of the prophets.

They abound in an acrid milky juice, which possesses active medicinal and sometimes poisonous properties. The blooming spurge, *E. corollata*, and the ipecac spurge, *E. ipecacuanha*, of the United States, and numerous other species, are employed medicinally in the countries where they are native. (See *euphorbium*.) Various species are also cultivated for ornament, as *E. marginata* for its color-margined leaves, *E. pulcherrima* for its bright-colored floral bracts, *E. fulgens* for its bright-red involucre, and several African species for their cactus-like habit, as *E. resinifera*.

The order includes the box-tree (*Buxus*), the cassava plant (*Manihot*), the castor-oil plant (*Ricinus*), the croton-oil and cascarilla plants (*Croton*), several species that furnish caoutchouc (*Hevea*, *Castilloa*, etc.), and numerous other more or less useful plants. The larger genera are *Euphorbia*, *Croton*, *Phyllanthus*, and *Acalypha*. **euphorbiaceous**, **euphorbial** (ū-fōr-bi-ā-shiūs, ū-fōr'bi-āl), *a.* Pertaining to or having the characteristics of the *Euphorbiaceae*.

Euphorbium*, formerly applied to the plant now distinguished as *Eupharbia*, *< Gr. εὐφώριον*, the African plant, also its acrid juice: see *Euphorbia*.] 1. A gum-resin, the product of *Euphorbia resinifera*, a leafless, cactus-like plant of Morocco. It is extremely acrid, and was formerly used, even by the ancients, as an emetic and a purgative, but it is now employed only as an ingredient in plasters and in veterinary practice.

It is astringent, and was formerly in repute as a remedy for diseases of the eyes.

The name *Euphuus* (prop. **Euphyes*) is taken from *Gr. εὐφύς*, well-shaped, of good natural disposition, naturally clever (*ὁ εὐφύς*, a man of genius), etc., *< εὐ*, well, + *φύς*, growth, stature, nature, *< φέρω*, produce, pass. *φύσσει*, grow.] In *Eng. lit.*, an affected literary style, originating in the fifteenth century, characterized by a wide vocabulary, alliteration, consonance, verbal antithesis, and odd combinations of words. The style, although bombastic and ridiculous originally, contributed to the flexibility and verbal resources of later English. It assumed its most extreme form in the works of John Lyly, called the Euphuist.

All our Ladies were then his [Lyly's] Scholars; and that Beauty in Court which could not Parley *Euphuisme* was as little regarded as She which now there speaks not French.

Edward Blount, in Lyly's Euphuus, Epist. to Reader.

The discourse of Sir Pierce Shafton, in "The Monastery," is rather a caricature than a fair sample of *euphuism*. Perhaps, indeed, our language is, after all, indebted to this writer [Lyly] and his *euphuism* for not a little of its present euphony. *Craik*, *Hist. Eng. Lang.*, I. 495.

So far, then, there is in the father of *euphuism* [Lyly] nothing but an exaggerated development of tastes and tendencies which he shared not only with a generation of writers, but with the literary currents of a century, indeed of more centuries than one.

A. W. Ward, *Eng. Dram. Lit.*, I. 156.

= *Syn.* This word is sometimes confounded with *euphemism* and *euphony*. It has nothing to do with either.

The all-seeing poet laughs rather at the pedantic school-master than at the fantastic knight; and the *euphuistic* pronunciation which he makes Holofernes so malignantly criticize was most probably his own and that of the generality of his educated contemporaries.

Craik, *Hist. Eng. Lang.*, I. 473.

The *euphuistic* style was an exaggeration of the "Italianating" taste which had begun with the revival of our poetical literature in the days of Henry VIII., but to which Lyly was the first to give full expression in prose.

A. W. Ward, *Eng. Dram. Lit.*, I. 157.

See *canal*.—**Eustachian tube**, the tube leading from the middle ear to the pharynx. It is the communication between the cavity of the tympanum and that of the mouth. Morphologically, this tube is a part of the remains of the primitive visceral cleft of the embryo which places the mouth in direct communication with the exterior through the ear. Were it not for the membrane of the tympanum or ear-drum, which stops up the passage, there would be nothing to prevent the passage of a sufficiently slender and flexible probe from the mouth through the Eustachian tube, tympanum, and external meatus of the ear, and the passage would correspond to that of a twig or the finger into a fish's mouth and out through one of the gill-slits. In man the Eustachian tube is 1½ to 2 inches long, directed downward, forward, and inward from the tympanum to the fauces. It is formed partly of bone, partly of gristly and fibrous tissue. The bony part, about half an inch long, is included in the temporal bone, between its squamosal and petrosal portions. The cartilaginous part is about an inch long, formed of a scroll-like piece of fibrocartilage, the interval between whose edges is completed by fibrous tissue. It is trumpet- or funnel-shaped, and ends by an oral orifice at the upper back part of the pharynx, a little to one side of the median line, and nearly opposite the middle meatus of the nose. The mucous membrane of the pharynx continues directly through the tube, and is covered with ciliated epithelium. Alloys are regarded as eutectic compounds, and the same principles apply to the mixtures of fused silicates of which volcanic glass, slags, etc., are formed.

Metallic alloys are true homologues of the cryohydrates; the ratios in which metals unite to form the alloy possessing the lowest melting-point are never atomic ratios, and when metals do unite in atomic ratios the alloy produced is never eutectic, i. e. having a minimum solidifying point. Thus pure cast-iron is not a carbide of iron, but an eutectic alloy of carbon and iron. Similar hyperchemical mass ratios are found to exist among anhydrous salts; when one

salt fused per se acts as a solvent to another salt, forming eutectic salt alloys, similar to eutectic metallic alloys and the cryohydrates. *F. Guthrie*, *Nature*, XXXIII. 21.

The process of evaporation is constantly going on at the surface of the earth, but principally at the surface of the sea and other

bodies of water. The vapor thus formed, being specifically lighter than atmospheric air, rises to considerable heights above the earth's surface, and afterward, by a partial condensation, forms clouds, and finally descends in rain. The effect of evaporation is to reduce the temperature of the evaporating surface, and the evaporation of certain volatile liquids, such as ether, produces an intense degree of cold. Evaporation by direct heat (boiling down) is often practised on fluids, especially in pharmacy and cookery, in order to reduce them to a denser consistence, or to obtain in a dry and separate state the fixed matters contained in them.

So in pestilent fevers, the intention is to expel the infection by sweat and *evaporation*. *Bacon*, Nat. Hist., § 968.

3. In *fencing*, the avoiding of a thrust by moving the body without changing the position of the feet. *Rolando* (ed. Forsyth). = *Syn. Evasion*. *Equivocation*, *Prevarication*, *Shift*, *Subterfuge*, quibble, all express artful or dishonorable modes of escaping from being frustrated or found out. The first three imply the use of language; *shift* and *subterfuge* may be by words or actions. *Evasion* in speech may be simply avoiding, as by turning the conversation or meeting one question with another. *Equivocation* is using words in double and deceptive senses. *Prevarication* may be in action, but is properly understood to be in words; it includes all tricks of language that fall short of downright falsehood; it is, literally, a stepping on both sides of the truth; the word is a strong one. All these words convey opprobrium in proportion to the amount of insincerity implied. *Shift* and *subterfuge* may be modes of *evasion*; *shift*, a thing turned to as a mean expedient, a trick; *subterfuge*, a place of hiding, hence an artifice. *Shift* does not necessarily express a dishonorable course, and *evasion* and *subterfuge* are often lightly used. See *artifice* and *expedient*, *n*.

This detached and insulated form of delivering thoughts (in aphorisms) was, in effect, an *evasion* of all the difficulties connected with composition.

2. In *astron.*: (a) The second lunar inequality, described by Ptolemy. It comes to its maximum value at the quadratures, and disappears at the conjunctions and oppositions. Ptolemy accounted for it by supposing that the apogee of the moon's orbit or deferent of its epicycle recedes to the west at a uniform angular rate of 11° 2' per diem, while the center of the epicycle advances to the east at a uniform angular rate of motion about the earth of 13° 11', the mean sun always bisecting the arc of the zodiac between the lunar apogee and the center of the lunar epicycle. This theory represented the longitudes with remarkable accuracy, but was utterly inconsistent with the most obvious observations respecting the moon's apparent diameter. According to modern astronomy, the *evectio* is a perturbation of the moon by the sun, due to the fact that the sun tends to separate the moon and the earth by attracting more the nearer body. It thus exaggerates the effect of the eccentricity of the moon's orbit when the transverse axis of the latter lies near the line of syzygies. (b) The moon's libration.—**Evectio** of heat, the diffusion of heated particles through a fluid in the process of heating it; convection.

A proposition containing *every* before a class name is equivalent to the totality of statements formed by replacing this expression by the name of each individual of the class. But if not placed before *every*, the meaning is that some one or more of these individual propositions are not true. Thus, "not every man is a poet" does not mean that not any man is a poet, but only that some men are not poets. In many cases, however, *every* is ambiguous.

(d) In a more restricted sense, that part of such information or testimony which is properly receivable or has actually been received by the court on the trial of an issue: sometimes more specifically characterized as *judicial evidence*: as, that is not evidence, my lord; the age of the accused is not in evidence. In this latter sense sometimes, especially in equity practice, spoken of as the *proofs*. (e) The rules by which the reception of testimony is regulated in courts of justice: as, a treatise on evidence; professor of pleading and evidence.—*Administrative, circumstantial, conclusive, cumulative, extrinsic, hearsay, etc., evidence*. See the adjectives.—*Demurrer to evidence*. See *demurrer*.—*Direct evidence*, that which goes expressly to the very point in question; that which, if believed, proves the point without aid from inference or reasoning, as the testimony of an eye-witness to an occurrence, as distinguished from *indirect* or *circumstantial evidence*, which goes expressly to other facts only, from which it is proposed to infer what was the fact on the point in question.—*Documentary evidence*, evidence supplied by written instruments.—*Documentary Evidence Act*, an English statute of 1868 (31 and 32 Vict., c. 37), making all laws, proclamations, and other official documents which purport to be printed in the *Gazette* or by the government printer, or certified by the clerk of the Privy Council, and also, by an amendment in 1882 (45 Vict., c. 9), if they purport to be printed by authority of Her Majesty's Stationery Office, receivable in evidence without further proof.—*Evidence aliunde*. See *aliunde*.—*Evidences of Christianity*. See *Christianity*.—*Formal evidence*, the character of the act of reason by which anything is recognized as certain and indubitable.—*Immediate evidence*, that state or degree of evidentialness which belongs to an object plainly perceived.—*In evidence*. (b) Plainly visible; conspicuous: a recent phrase adopted from the French *en évidence*.—*Instruments of evidence*, the media, such as witnesses, documents, etc., through which the evidence of facts is conveyed to the mind of a judicial tribunal. *Best*.—*King's evidence*, *queen's evidence*, *state's evidence*, one charged with a crime who waives his privilege against criminating himself in order that his testimony as a witness may be used to convict another implicated with him.—*Law of evidence*, that part of the law which determines the necessity, the methods, and the sufficiency of proof of facts as a basis for the administration of justice. It is a system consisting partly of principles and partly of artificial rules, established partly by precedent and partly by statute, and originating partly in logical principles and partly in judicial experience in investigating controversies by means of human testimony; the object of the system being to guide courts in deciding what subjects require proof, what facts are to be received as evidence, what testimony or documents may be used for the purpose and in what manner, and what the effect of evidence thus received should be.—*Mediate evidence*, the clearness and force of a demonstration.—*Moral evidence*, the evidence of an irresistible probable argument.—*Negative evidence*. See *positive evidence*.—*Objective evidence*, the character of the object of a certain and indubitable cognition.—*Opinion evidence*. See *opinion*.—*Oral evidence*, *parol evidence*, evidence by word of mouth; testimony, as distinguished from documentary evidence. Testimony taken by deposition, and thus presented in writing, is deemed oral evidence, not documentary evidence.—*Positive evidence*. (a) Direct evidence (which see, above). (b) Testimony to having witnessed an act or event, as distinguished from *negative evidence*, or the testimony of a witness who was present and observant, that such act or event did not take place. As between equally credible witnesses, positive testimony is entitled to more weight than negative, because it may be that one witness, though present, did not see or hear that another witness did.—*Presumptive evidence*, *prima facie evidence*, evidence sufficient if not controverted; used technically in two distinct senses which are often confused—(a) Evidence sufficient to go to the jury, and on

which therefore it would be error for the judge to decide in place of the jury, but on which the jury may fairly decide either way. (b) Evidence sufficient not only to go to the jury, but to require them to find accordingly if no credible contrary evidence be given.—*Primary evidence*, the best evidence, as distinguished from *secondary evidence*; or evidence of such a nature as to imply (unless explanation is given) that better evidence exists and is kept back. Thus, if it is sought to prove the contents of a written contract, the instrument itself is the best evidence of the contents, and it must be produced, or satisfactory excuse must be given, before witnesses can be allowed to testify what the contents were. But among such witnesses the testimony of the writer of it, though more satisfactory than that of others, is not therefore deemed the best or primary evidence in the technical sense.—*Real evidence*, the evidence afforded by inspection or actual examination of the person or thing by the court or jury, when the question involves the condition of such person or thing.—*Satisfactory evidence*, or *sufficient evidence*, such evidence as in amount is adequate to justify the court or jury in adopting the conclusion in support of which it is adduced.—*Secondary evidence*, evidence not primary, but which may be admitted upon showing proper reasons for failure to obtain primary evidence.—*Syn. Testimony, Evidence, Proof, Exhibit*, deposition, affidavit. In law, *testimony* is evidence given by witnesses. *Evidence* is the broader term, including that which is given by witnesses or afforded by documents or by the inspection of the person or object itself. *Proof* is the effect of evidence in establishing the conclusion of fact to support which it is adduced. *Proofs* are the evidence in a cause, including testimony and documents. An *exhibit* is a document which has been presented as evidence.

Hence—2. The process of evolving or becoming developed; an unfolding or growth from, or as if from, a germ or latent state, or from a plan; development: as, the *evolution* of history or of a dramatic plot.

The whole *evolution* of ages, from everlasting to everlasting, is so collected and presentifically represented to God at once, as if all things which ever were, are, or shall be, were at this very instant really present.

The *evolution* of the sickening vapours emitted by foul oxide need not be a source of annoyance, as the oxide can be revived in the purifiers.

W. R. Bouditch, Coal Gas, xi. 21.

Specifically—(a) In *biol.*: (1) The actual formation of a part or of the whole of an organism which previously existed only as a germ or rudiment; ordinary natural growth, as of living creatures, from the germinal or embryonic to the adult or perfect state: as, the *evolution* of an animal from the ovum, or of a plant from the seed; the *evolution* of the blossom from the bud, or of the fruit from the flower; the *evolution* of the butterfly from the caterpillar; the *evolution* of the brain from primitive cerebral vesicles, or of the lungs from an offshoot of the intestine. (2) The release, emergence, or exclusion of an animal or a plant, or of some stage or part thereof, from any covering which contained it: as, the *evolution* of spores from an encysted animalcule; the *evolution* of a moth from the cocoon, of an insect from the wood or mud in which it lived as a larva, of a chick from the egg-shell which contained it as an embryo.

The parasite is often taken for the Hessian fly. . . . Many have been deceived by the specious circumstance of its *evolution* from the pupa of the destroying insect. *Say*.

(3) Descent or derivation, as of offspring from parents; the actual result of generation or procreation. As a fact, this *evolution* is not open to question. As a doctrine or theory of generation, it is susceptible of different interpretations. In one view, the germ actually preexists in one or the other parent, and is simply unfolded or expanded, but not actually formed, in the act of procreation. (See *ovulist*, *spermatist*.) This view is now generally abandoned, the current opinion being that each parent furnishes materials for or the substance of the germ, whose *evolution* results from the union of such elements. See *epigenesis*.

(4) The fact or the doctrine of the derivation or descent,

with modification, of all existing species, genera, orders, classes, etc., of animals and plants, from a few simple forms of life, if not from one; the doctrine of derivation; evolutionism. (See *Darwinism*.) In this sense, *evolution* is opposed to *creationism*, or the view that all living things have been created at some time substantially as they now exist. Modern evolutionary theories, however, are less concerned with the problem of the origination of life than with questions of the ways and means by which living organisms have assumed their actual characters or forms. Phylogenetic evolution insists upon the direct derivation of all forms of life from other antecedent forms, in no other way than as, in ontogeny, offspring are derived from parents, and consequently grades all actual affinities according to propinquity or remoteness of genetic succession. It presumes that, as a rule, such derivation or descent, with modification, is from the more simple to the more complex forms, from low to high in organization, and from the more generalized to the more specialized in structure and function; but it also recognizes retrograde development, degeneration or degradation. The doctrine is now accepted by most biologists as a conception which most nearly coincides with the ascertained facts in the case, and which best explains observed facts, though it is held with many shades of individual opinion in this or that particular. See *natural selection*, under *selection*.

Evolution, or development, is, in fact, at present employed in biology as a general name for the history of the steps by which any living being has acquired the morphological and the physiological characters which distinguish it. *Huxley, Evolution in Biology*.

(b) In general, the passage from unorganized simplicity to organized complexity (that is, to a nicer and more elaborate arrangement for reaching definite ends), this process being regarded as of the nature of a growth. Thus, the development of planetary bodies from nebular or gaseous matter, and the history of the development of an individual plant or animal, or of society, are examples of *evolution*.

Evolution is an integration of matter and concomitant dissipation of motion; during which the matter passes from an indefinite, incoherent homogeneity to a definite, coherent heterogeneity; and during which the retained motion undergoes a parallel transformation.

H. Spencer, First Principles, § 145.

The hypothesis of *evolution* supposes that in all this vast progression there would be no breach of continuity, no point at which we could say, "This is a natural process," and, "This is not a natural process;" but that the whole might be compared to that wonderful process of development which may be seen going on every day under our eyes, in virtue of which there arises, out of the semi-fluid, comparatively homogeneous substance which we call an egg, the complicated organization of one of the higher animals. That, in a few words, is what is meant by the hypothesis of *evolution*. *Huxley, Amer. Addresses*, p. 10.

(c) Continuous succession; serial development.

3. In *math.*: (a) In *geom.*, the unfolding or opening of a curve, and making it describe an *evolvent*. The *evolvent* of the periphery of a circle or other curve is such a gradual approach of the circumference to straightness that its parts do not concur and equally evolve or unbend, so that the same line becomes successively a smaller arc of a reciprocally greater circle, till at last they change into a straight line. (b) The extraction of roots from powers: the reverse of *involution* (which see).—4. A turning or shifting movement; a passing back and forth; change and interchange of position, especially for the working out of a purpose or a plan; specifically, the movement of troops or ships of war in wheeling, countermarching, maneuvering, etc., for disposition in order of battle or in line on parade: generally in the plural, to express the whole series of movements.

These *evolutions* are doublings of ranks or files, countermarches, and wheelings. *Harris*.

5. That which is evolved; a product; an outgrowth.

evolutionary (ev-ō-lū'shon-ā-ri), *a.* [*L. evolution* + -*ary*.] 1. Of or pertaining to evolution or development; developmental: as, the *evolutionary* origin of species.

2. Of or pertaining to evolutions or manoeuvres, as of an army, a fleet, etc.

The French are making every effort to perfect the training of their naval officers and seamen. *Evolutionary* squadrons are constantly at sea, accompanied by rams and torpedo-boats. *N. A. Rev.*, CXXXIX. 435.

evolutionism (ev-ō-lū'shon-izm), *n.* [*L. evolution* + -*ism*.] The metaphysical or the biological doctrine of evolution or development.

I do not know whether *Evolutionism* can claim that amount of currency which would entitle it to be called

British popular geology; but, more or less vaguely, it is assuredly present in the minds of most geologists.

Huxley, Lay Sermons, p. 243.

Those who find most satisfaction in insisting upon evolutionism as a finality are those who, unlike positivists, need a creed.

G. S. Hall, German Culture, p. 189.

The context shows that "uniformitarianism" here means that doctrine, as limited in application by Hutton and Lyell, and that what I mean by evolutionism is consistent and thoroughgoing uniformitarianism.

Huxley, in Nineteenth Century, XXI. 486, note.

evolutionist (ev-ō-lū'shon-ist), *n.* and *a.* [*< evolution + -ist.*] *I. n.* 1. One skilled in evolutions, specifically in military evolutions.—2. A believer in the biological or cosmological doctrine of evolution.

II. a. Of or pertaining to the doctrine of evolution; based upon or believing in the doctrine of evolution.

ex⁵ (eks), *prep.* [L. *ex*, prep., out of, from. See *ex-*.] A Latin preposition, meaning 'out,' 'out of.' It is used in English only in certain commercial formulas, as—(a) "20 chests tea *ex* Sea-King," where *ex* means taken out of or delivered from the vessel named; (b) "ex *div.*"—that is, without dividend (meaning that the dividend on the stocks sold has been declared and is reserved by the seller); and in some Latin phrases: *ex mero motu*, of his own accord; *ex necessitate rei*, from the necessity of the case; *ex officio*, by virtue of his office; *ex parte*, on one side only; *ex post facto* (which see); *ex vi termini*, from the very meaning of the term.

ex- [ME. *ex-*, *es-*, *as-*, OF. *ex-*, *es-*, F. *ex-*, *é-* = Sp. *ex-*, *es-* = It. *ex-*, *es-*, *s-*, etc., < L. *ex-*, prefix, < *ex*, prep. (so always before vowels, before consonants either *ex* or *e*, more frequently *ex*), of place, out of, from, away from, beyond; of time, after, from, since; of cause, from, through, by reason of, etc.; in comp., out, forth, out of, throughout, to the end, hence thoroughly, utterly, etc. (equiv. to *out* or *up* used intensively); in LL. *ex-* is also used, as now in E., to signify 'out of office': *exconsularis*, an ex-consul, etc. As a prefix *ex-* stands before vowels and *h* and before *e*, *p*, *q*, *t*, and before *s*, the *s* being in this case optionally dropped: e. g., *existere* (**exsistere*) or *existere*, exist, one *s*, orthographically the second, phonetically the first (*existere* being pronounced *ec-sistere*), being omitted; before *f* *ex-* becomes *ef-*, sometimes *ec-*, rarely remaining unchanged; elsewhere *c-*. L. *ex* = Gr. *ξ* (before a vowel), *ἐκ* (before a consonant), out of, from (in comp. *ἐξ-, ἐκ-*), = Russ. *iz*, out. In ME., OF., Sp., etc., *ex-* may appear as *es-*; ME. also *as-*, and sometimes by confusion or interchange *en-* (cf. *example*, ME. *ex-*, *es-*, *as-*, and *en-sample*). In most cases of this kind the L. form *ex-* has been restored. See further under *es-*.] A prefix of Latin, and in some cases of Greek origin, meaning primarily 'out,' 'out of.' In English words it preserves or reproduces its particular uses in the language of its origin. (See etymology.) Thus, in *exclude*, *exhale*, etc., it signifies 'out,' 'out of'; in *excise*, 'off'; in *exceed*, *excel*, etc., 'beyond.' It is often (especially in the reduced form *e-*) simply privative, as in *exstipulate*, *explicate*. In some words it is intensive merely, in others it has no particular force. Prefixed to names implying office, *ex-* signifies that the person has held but is now 'out of' that office: as, *ex-president*, *ex-minister*, *ex-senator*.

Ex. An abbreviation of *Exodus*.

= **Syn. 1.** *Examination, Inquiry, Investigation, Inquisition, Scrutiny, Search, Research, Inspection*; overhauling, probing, canvassing. *Examination* is the general word; where it is applied to any work of severity, thoroughness, etc., the fact is expressed by a strong adjective or other modifier: as, a superficial, thorough, brief, protracted, or searching *examination* into facts, into a question, of a candidate, or of a locality or premises. *Inquiry* is made by asking questions, but figuratively by study or *investigation*: as, an *inquiry* into the value of circumstantial evidence. An *investigation* is an *examination* long enough, systematic enough, and minute enough to be thorough. An *inquisition* is something still more thorough and searching than an *investigation*, implying vigor with severity; in modern times it generally implies a somewhat hostile spirit, or that from which the person concerned would shrink. *Scrutiny* is primarily a close examination with the eye: as, the *scrutiny* of one's features, of a manuscript, of a field of vision; but it is also a critical examination by the mind: as, the careful *scrutiny* of evidence. *Search* is the effort to find primarily that which may be seen, but secondarily that which may be apprehended by the mind: as, the *search* for a lost coin, or for a clue to a mystery. *Research* is *search* only of the second class above, and in out-of-the-way fields of knowledge; as, archaeological *research*. *Inspection*, literally a looking into, is sometimes a rather general word and equivalent to *examination*; but more often it implies an official *examination*: as, an *inspection* of work done under contract; the sanitary *inspection* of a jail, or of a ship just come into port.

Davenant emulated Spenser; and if his poem "Gondibert" had been as good as his preface, it could still be read in another spirit than that of *investigation*.

2. An instance serving for illustration; a particular case or circumstance, quotation, or other thing, illustrating a general statement, proposition, rule, or truth. [Though etymologically the same as *sample*, an *example*, in this use of the word, is not, like a sample, commonly taken at random, but chosen with care for the purpose of aiding the mind of a reader or hearer in comprehending an abstract proposition or description. An *example* is, in fact, but a single instance, either given alone or with a small number of others, and in such a manner that the reader or person addressed has no means of judging as to how it has been chosen; it therefore affords little or no ground for inductive reasoning. See *sample*.]

= *Syn.* *Exemple*, *Pattern*, *Model*, *Precedent*, *Ideal*, *Instance*; archetype, prototype; exemplification. *Example* is the most general of these words; it is the only one of them that admits application to that which is to be avoided. An *example* is something to guide the understanding, so that one may decide what to do and what not to do. *Pattern* and *model* express that which is to be closely followed or copied; they primarily refer to physical shape: as, an artist's *model*; but also freely to the shaping of conduct and character: as, a *pattern* of sobriety; a *model* of virtue. Perhaps *model* suggests the more complete *example*, but the difference between the two words in this respect is small. A *precedent* is an *example* set in the past, as a legal decision which may be pleaded in law as the basis of a further decision, and in private affairs a thing once done or allowed, and so pleaded as a reason or an excuse for more of the same sort: as, a *precedent* for indulgence. An *ideal* is a model of perfection, primarily imaginary, but by hyperbole sometimes real. An *example* is generally a representative person or thing, but the word is sometimes used instead of *instance* with reference to a representative act or course of conduct: as, to prove a rule by *examples*; to prove a man's fidelity or treachery by *instances* or *examples*.

5. In law: (a) In conveyancing, a clause in a deed taking out something from that which appears to be granted by the preceding part of the deed, by which means it is severed from the estate granted, and does not pass. (b) The thing or part of the premises thus withheld. (c) In equity practice, an allegation, required to be in writing, pointing out the particular matter in an adversary's pleading which is objected to as insufficient or improper. (d) In common-law practice, the specific statement, required to be in writing or noted on the record, of an objection taken by a party to a ruling or decision by the court or a referee, the object being to show to the higher court to which the matter may be appealed that the ruling was adhered to and carried into effect against explicit objection, or to inform the adverse party of the precise point of the objection, or both. See *bill of exceptions*, below.

In the Roman law *exceptio* was a plea similar to our confession and avoidance. Thus, such a plea would be a claim to offset a debt. In a narrower sense, however, it was restricted to the plea that an action competent in law should be excluded on the ground of equity. Such a plea was held to be dangerous, because, the facts alleged by way of exception being once disproved, the claim of the plaintiff was held to be proved as good in law by the pleading of the *exceptio*. Hence, probably, the maxim "The *exceptio* proves the rule" (Latin *exceptio probat regulam*), in 1 Coke 41; French *l'exception prouve la règle*, which is certainly of legal origin. The words "in cases not excepted" (Latin *in casibus non exceptis*) are, however, commonly added; and the maxim is taken to mean that an express exception implies that the general rule is the opposite of the case mentioned.

As *exception* corroborates the application of law in cases not excepted, so enumeration invalidates it in cases not enumerated.

Bacon, De Augmentis (ed. Spedding), VIII. iii.

If it be well weighed, that certificate makes against them: for as *exceptio firmat legem in casibus non exceptis*, so the excepting of that shire by itself doth fortify that the rest of the shires were included in the very point of difference.

F. *échiquier*) (ML. *saccarium*), a chess-board, checker-board; hence, the checkered cloth on which accounts were calculated by means of counters; then applied to a court of revenue, and the public treasury; *< OF. eschees, chess, eschech, echeek* at chess: see *check*, and cf. *checker*, the more vernacular form of *exchequer*.] 1. [*cap.*] In England, an ancient court or tribunal, more fully designated the *Court of Exchequer*, in which all causes affecting the revenues of the crown were tried and decided. In course of time it acquired the jurisdiction of ordinary superior common-law courts, by allowing any suitor who desired to bring his complaint before it to allege that by the defendant's injustice he was prevented from discharging his debts to the king's revenues, which allegation the court did not allow to be denied. The court also had, up to 1841, an equity side. The judges were called barons. In 1875 the court was made the Exchequer Division of the new High Court of Justice.

The *Exchequer* of the Norman kings was the court in which the whole financial business of the country was transacted; and as the whole administration of justice, and even the military organisation, was dependent upon the fiscal officers, the whole framework of society may be said to have passed annually under its review. It derived its name from the checkered cloth which covered the table at which the accounts were taken, a name which suggested to the spectator the idea of a game at chess between the receiver and the payer, the treasurer and the sheriff. As this name never occurs before the reign of Henry I., and as the tradition of the court preserved the remembrance of a time when the business which took place in it was transacted 'ad taleas,' 'at the tallies,' it seems certain that the date of complete organisation should be referred to this period. Stubbs, Const. Hist., § 126.

Appeal from its decision lay to the House of Lords. It was supplanted by the Court of Appeal in 1875.—**Exchequer bill,** a negotiable interest-bearing bill of credit, issued under the authority of acts of Parliament, by the Exchequer Department of the British government, for the purpose of raising money for temporary purposes, or to meet some sudden emergency. Exchequer bills run for five years; the interest is payable per attached coupons half-yearly, and is fixed every year, but can never exceed 5½ per cent. per annum. They are issued for sums of £100 each, or some multiple of £100. They were first issued in 1696, and form a large part of the unfunded public debt of Great Britain.—**Exchequer bonds,** bonds issued in Great Britain by the Commissioners of the Treasury, under authority of the same act as exchequer bills, and for the same purpose, which run for a definite period of time, not exceeding six years, the interest payable on the same, which can never exceed 5½ per cent. per annum, being fixed at the time of issue.

Because thou hast neglected to abstain from the House of that *Excommunicate*, in that House thou shalt die.

Milton, *Hist. Eng.*, iv.

I . . . was accordingly considered an *excommunicate*, and had so many little pieces of private malice practised on me . . . that I found myself obliged to comply and pay the money.

Franklin, *Autobiog.*, p. 79.

excommunication (eks-ko-mū'ni-kā'shōn), *n.* [= F. *excommunication* = Pr. *escomeniazon* = Sp. *excomulgacion*, *excomunicacion* (obs.) = It. *escomunicazione*, *scomunicazione*, < *LL. excommunicatio* (*n.*), < *excommunicare*, pp. *excommunicatus*, excommunicate: see *excommunicate*, *v.*] A cutting off or casting out from communion; deprivation of communion or the privileges of intercourse; specifically, the formal exclusion of a person from religious communion and privileges. Excommunication, often with very severe consequences, was practised in various ways among the ancient Greeks, Romans, and Jews, and is still in use among the Mohammedans. In the early Christian church it consisted simply in the exclusion of an offending member from fellowship by some formal action, and this is the practice in most modern Protestant churches. As the power of the church increased, excommunication became more complicated in method and severe in effect. As now practised in the Roman Catholic and related churches, it may be either partial or total, temporary or perpetual. By the partial, called the *minor* or *lesser excommunication*, the offender is suspended from the use of the sacraments, and perhaps from the privileges of church worship; by the total, or the *major* or *greater excommunication*, he is also cut off from the society and fellowship of the church, and it may be from all intercourse with its members. Further distinctions as to the sentence and its effects are made in the Roman Catholic Church. See *anathema*, *discipline*.

Bring into the Church of England open discipline of *excommunication*, that open sinners may be stricken withal.

Latimer, 2d Sermon bef. Edw. VI., 1550.

The act of *excommunication* . . . neither shutteth out from the mystical, nor clear from the visible, but only from fellowship with the visible in holy duties.

Hooker, *Eccles. Polity*, iii. 1.

Excommunication seems but a light thing when there are many communions. It was no light thing when it was equivalent to outlawry; when the person excommunicated might be seized and imprisoned at the will of the ordinary; when he was cut off from all holy offices; when no one might speak to him, trade with him, or show him the most trivial courtesy; and when his friends, if they dared to assist him, were subject to the same penalties.

Two such areas, as P and Q, being given, it is shown that there is a series of rectilinear constructions, x_1, x_2 , etc., all less than P, but each after the first differing from it by less than half as much as the one preceding it in the series. Suppose there is another series of constructions, y_1, y_2 , etc., related in the same way to Q. Then, if $x_1 : y_1 = x_2 : y_2 = \text{etc.}$, it will follow that $x_1 : y_1 = P : Q$. The standard example of this method is the second proposition of the twelfth book of Euclid.

= **Syn.** *Exhibition, Exhibit, Exposition, Exposure, Exposed*; manifestation. *Exhibition* is more general than *exhibit*, the latter expressing sometimes a section of the former. As contrasted with *exposition*, *exhibition* deals more often with visible things and *exposition* with things mental: as, an *exhibition* of machinery; an *exposition* of a text or doctrine of philosophy. New freedom could not exist in safety under the old tyrant.

Upon a very common confusion of the word *exist* with the verb *to be*, which does not necessarily imply existence, he founded his argument against the possibility of creation: creation cannot be, for being cannot arise out of non-being; nor can non-being be. *Encyc. Brit., VIII. 1.*

S. Hodgson, Philos. of Reflection, III. vii. § 1.

2. Expressing or stating the fact of existence.

Convention does not allow us to say "It executes," as we say "It blows" or "It thunders," because (if for no other reason) the group of phenomena is not one of familiar immemorial occurrence. But we can just as conveniently adopt the *existential* form, "There was an execution," as the predicative form, "A man was hanged"; and as a matter of fact, one form would be as readily employed as the other.

H. James, Jr., Pass. Pilgrim, p. 220.

2. The state of being expanded; enlargement; distention; dilatation; increase of extent, size, bulk, amount, etc. In the case of the expansion of solids by heat, account is taken of the increase in length or linear expansion, in surface (superficial expansion), and in volume (cubical expansion). The increment in length of the unit for a change of 1° in temperature, or the rate of increase of the unit with the temperature, is called the coefficient of linear expansion; and the coefficients of superficial and cubical expansion, which are respectively two and three times the linear coefficient, are similarly defined. In the case of liquids and gases the expansion in volume is alone considered. The real or absolute expansion of a liquid is the actual increase in volume, while the apparent expansion is that which is observed when a liquid contained in a vessel is heated, and which is less than the real expansion, because of the simultaneous expansion of the vessel itself. It is found that the coefficient of expansion is nearly the same for different gases, and sensibly so for the so-called permanent gases, as hydrogen, oxygen, etc. This coefficient is equal to .003667 for 1° C., or about $\frac{1}{273}$ —that is, at 273° C. the volume of a gas expanding under constant pressure is double its volume at 0°; and at -273° C. the volume would be theoretically zero. This last temperature is called the absolute zero.

Spread not into boundless *expansions* either of designs or desires.

Through seas and fertile plains, and all that lies
Beneath the starry *expansion* of the skies.

Beattie, Lucretius, i.

Distance or space, in its simple abstract conception, to avoid confusion, I call *expansion*, to distinguish it from extension, which by some is used to express this distance only as it is in the solid parts of matter, and so includes or at least intimates the idea of body. I prefer also the word *expansion* to space, because space is often applied to distance of fleeting successive parts, as well as to those which are permanent.

expansion-gear (eks-pan'shon-gēr), *n.* In a steam-engine, all those parts of the mechanism that control the admission of the live steam from the boiler to the main valve-system and thus to the cylinder. The expansion-gear is intermediate between the actual controlling system of mechanism, which makes the engine automatic, and the steam,

controlling the automatic system by independent eccentric systems that may be automatic or may be controlled by the governor or by appliances practically outside the engine. The effect of this supplementary system is to cut off the supply of steam to the slide-valves at any required point of the stroke, for the purpose of using the expansion of the steam already admitted to finish the stroke. This cut-off of the steam may be variable where the expansion admits of it, changing the point of cut-off at will while the engine is at work; it may be fixed or secured at some predetermined point of the stroke; or it may be automatic or self-varying. The most common apparatus includes an expansion-valve moving on the slide valve and controlled by an eccentric cam on the shaft or by the governor. See *cut-off* and *link-motion*.

expansion-valve (eks-pan'shon-valv), *n.* In a steam-engine, a valve which shuts off the steam in its passage to the slide-valves when the piston has traveled a certain distance in the cylinder, leaving the remaining part of the stroke to be performed by the expansion of the steam. See *expansion-gear*.

But outside of legal use the term often insinuates partiality or deficient accuracy: as, a mere *ex-parte* statement.—**Ex-parte council**, In *congregationalism*, a council called by one of the parties concerned in a controversy when the other party or the church refuses to coöperate in calling a mutual council.

Councils are of two kinds—mutual and *ex-parte*. A mutual council is one in the calling of which all parties to the difficulty or perplexity concerning which relief is sought unite. An *ex-parte* council is one which is called by one of those parties, after every proper effort to induce all interested to call a mutual council has failed.

Through the whole system of society expediency is the only governing principle.

Brougham.

This will hardly be deemed strongly ethical language: to many it will sound like the language of expediency rather than of ethics.

Bibliotheca Sacra, XLIII. 539.

The ill-repute which attaches to considerations of expediency, so far as it is well founded, is chiefly due to the fact that, when the question of conduct at issue is one which the person debating it has a private interest in deciding one way or the other—when he himself will gain pleasure or avoid pain by either decision—the admission of expediency as the ground of decision is apt to give him an excuse for deciding in his own favour.

= *Syn.* Expedient, Resource, Resort, Contrivance, Device, Shift. Expedient, contrivance, and device indicate artificial means of escape from difficulty or embarrassment; resource indicates natural means or something possessed; resort and shift may indicate either. A shift is a temporary, poor, or desperate expedient. When one's resources begin to fail, one has recourse to contrivances, expedients, etc., and finally to almost any shift. Resort is less often applied to the thing resorted to than to the act of resorting. Contrivance and device suggest most of ingenuity.

A single dot under a vowel in an unaccented syllable indicates its abbreviation and lightening, without absolute loss of its distinctive quality. See Preface, p. xi. Thus:

ā as in prelate, courage, captain.
 ē as in ablegate, episcopal.
 ō as in abrogate, eulogy, democrat.
 ū as in singular, education.

A double dot under a vowel in an unaccented syllable indicates that, even in the mouths of the best speakers, its sound is variable to, and in ordinary utterance actually becomes, the short u-sound (of but, pun, etc.). See Preface, p. xi. Thus:

ā as in errant, republican.
 ā as in prudent, difference.
 ā as in charity, density.
 ā as in valor, actor, idiot.
 ā as in Persia, peninsula.
 ā as in the book.
 ā as in nature, feature.

A mark (˘) under the consonants t, d, s, z indicates that they in like manner are variable to ch, j, sh, zh. Thus:

t as in nature, adventure.
 d as in arduous, education.
 s as in leisure.
 z as in seizure.

th as in thin.
 th as in then.
 ch as in German ach, Scotch loch.
 n French nasalizing n, as in ton, en.

ly (in French words) French liquid (mouillé) l.
 ' denotes a primary, " a secondary accent. (A secondary accent is not marked if at its regular interval of two syllables from the primary, or from another secondary.)
